

2.2.9.1

2.2.9.1 XML Provisioning Schema

The entire XML provisioning document is **base64-encoded**. The document contains:

- The requested client **certificate**, the trusted root certificate, and intermediate certificates.
- The provisioning information for the **device management client**.

The **enrollment client** installs the client certificate, as well as the trusted root certificate and intermediate certificates. The **provisioning information** includes content such as the location of the **Device Management Service (DMS)** and various properties that the device management client uses to communicate with the **DMS**.

The following ~~schema is an example~~[schemas are examples](#) of the XML required for the provisioning document. The explanation for each field in the document appears inline in the example as XML comments.

[The following XML is a provisioning example for Mobile Device Management \(MDM\) in user context.](#)
