## [MC-DPL8CS]:

## **DirectPlay 8 Protocol: Core and Service Providers**

#### **Intellectual Property Rights Notice for Open Specifications Documentation**

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights**. This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- No Trade Secrets. Microsoft does not claim any trade secret rights in this documentation.
- Patents. Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft Open Specifications Promise or the Microsoft Community Promise. If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplq@microsoft.com.
- **License Programs**. To see all of the protocols in scope under a specific license program and the associated patents, visit the <u>Patent Map</u>.
- **Trademarks**. The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit <a href="https://www.microsoft.com/trademarks">www.microsoft.com/trademarks</a>.
- **Fictitious Names**. The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights**. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

**Tools**. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

**Support.** For questions and support, please contact dochelp@microsoft.com.

# **Revision Summary**

Date	Revision History	Revision Class	Comments
8/10/2007	0.1	Major	Initial Availability
9/28/2007	0.2	Minor	Clarified the meaning of the technical content.
10/23/2007	0.2.1	Editorial	Changed language and formatting in the technical content.
11/30/2007	1.0	Major	Updated and revised the technical content.
1/25/2008	2.0	Major	Updated and revised the technical content.
3/14/2008	3.0	Major	Updated and revised the technical content.
5/16/2008	4.0	Major	Updated and revised the technical content.
6/20/2008	5.0	Major	Updated and revised the technical content.
7/25/2008	6.0	Major	Updated and revised the technical content.
8/29/2008	7.0	Major	Updated and revised the technical content.
10/24/2008	8.0	Major	Updated and revised the technical content.
12/5/2008	9.0	Major	Updated and revised the technical content.
1/16/2009	10.0	Major	Updated and revised the technical content.
2/27/2009	11.0	Major	Updated and revised the technical content.
4/10/2009	12.0	Major	Updated and revised the technical content.
5/22/2009	12.1	Minor	Clarified the meaning of the technical content.
7/2/2009	13.0	Major	Updated and revised the technical content.
8/14/2009	14.0	Major	Updated and revised the technical content.
9/25/2009	14.1	Minor	Clarified the meaning of the technical content.
11/6/2009	14.1.1	Editorial	Changed language and formatting in the technical content.
12/18/2009	14.1.2	Editorial	Changed language and formatting in the technical content.
1/29/2010	15.0	Major	Updated and revised the technical content.
3/12/2010	15.0.1	Editorial	Changed language and formatting in the technical content.
4/23/2010	16.0	Major	Updated and revised the technical content.
6/4/2010	17.0	Major	Updated and revised the technical content.
7/16/2010	18.0	Major	Updated and revised the technical content.
8/27/2010	18.0	None	No changes to the meaning, language, or formatting of the technical content.
10/8/2010	18.0	None	No changes to the meaning, language, or formatting of the technical content.
11/19/2010	18.0	None	No changes to the meaning, language, or formatting of the technical content.

Date	Revision History	Revision Class	Comments
1/7/2011	18.0	None	No changes to the meaning, language, or formatting of the technical content.
2/11/2011	18.0	None	No changes to the meaning, language, or formatting of the technical content.
3/25/2011	18.0	None	No changes to the meaning, language, or formatting of the technical content.
5/6/2011	18.0	None	No changes to the meaning, language, or formatting of the technical content.
6/17/2011	18.1	Minor	Clarified the meaning of the technical content.
9/23/2011	18.1	None	No changes to the meaning, language, or formatting of the technical content.
12/16/2011	19.0	Major	Updated and revised the technical content.
3/30/2012	19.0	None	No changes to the meaning, language, or formatting of the technical content.
7/12/2012	19.0	None	No changes to the meaning, language, or formatting of the technical content.
10/25/2012	19.0	None	No changes to the meaning, language, or formatting of the technical content.
1/31/2013	19.0	None	No changes to the meaning, language, or formatting of the technical content.
8/8/2013	20.0	Major	Updated and revised the technical content.
11/14/2013	20.0	None	No changes to the meaning, language, or formatting of the technical content.
2/13/2014	20.0	None	No changes to the meaning, language, or formatting of the technical content.
5/15/2014	20.0	None	No changes to the meaning, language, or formatting of the technical content.
6/30/2015	21.0	Major	Significantly changed the technical content.
10/16/2015	21.0	None	No changes to the meaning, language, or formatting of the technical content.
7/14/2016	21.0	None	No changes to the meaning, language, or formatting of the technical content.
6/1/2017	21.0	None	No changes to the meaning, language, or formatting of the technical content.
9/15/2017	22.0	Major	Significantly changed the technical content.
9/12/2018	23.0	Major	Significantly changed the technical content.
4/7/2021	24.0	Major	Significantly changed the technical content.
6/25/2021	25.0	Major	Significantly changed the technical content.
4/23/2024	26.0	Major	Significantly changed the technical content.

#### 1 Introduction

This specification describes the core protocol services of the DirectPlay 8 Protocol. The protocol provides functionality necessary for multiplayer game communication, including the ability to create and manage game sessions over existing datagram protocols such as **User Datagram Protocol (UDP)**. The DirectPlay 8 Protocol: Core and Service Providers relies on the DirectPlay 8 Protocol: Reliable (as specified in <a href="MC-DPL8R">[MC-DPL8R</a>]) to manage network connections, to send and receive packets, and to perform reliable communication.

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

#### 1.1 Glossary

This document uses the following terms:

- **acknowledgment (ACK)**: A signal passed between communicating processes or computers to signify successful receipt of a transmission as part of a communications protocol.
- client/server mode: A mode that consists of one server with many client connections (one-to-many). From the perspective of each client, there is only one connection: the connection to the server.
- data frame (DFRAME): A DirectPlay 8 frame that exists in the standard connection sequence space and typically carries application payload data. The total size of the DFRAME header and payload are to be less than the Maximum Transmission Unit (MTU) of the underlying protocols and network. For more information, see the DirectPlay 8 Protocol: Reliable Specification (<a href="MC-DPL8R">[MC-DPL8R</a>] section 2.2.2). See Also, command frame.
- **DirectPlay**: A network communication library included with the Microsoft **DirectX** application programming interfaces. **DirectPlay** is a high-level software interface between applications and communication services that makes it easy to connect games over the Internet, a modem link, or a network.
- **DirectPlay 8**: A programming library that implements the IDirectPlay8 programming interface. **DirectPlay 8** provides peer-to-peer session-layer services to applications, including session lifetime management, data management, and media abstraction. **DirectPlay 8** first shipped with the DirectX 8 software development toolkit. Later versions continued to ship up to, and including, DirectX 9. **DirectPlay 8** was subsequently deprecated. The **DirectPlay 8** DLL continues to ship in current versions of Windows operating systems, but the development library is no longer shipping in Microsoft development tools and Software Development Kits (SDKs).
- **DirectX**: Microsoft **DirectX** is a collection of application programming interfaces for handling tasks related to multimedia, especially game programming and video, on Microsoft platforms.
- **DirectX Diagnostic (DXDiag)**: DXDiag.exe is an application that uses the DirectPlay DXDiag Usage Protocol [MS-DPDX] traffic.
- **DPNID**: A 32-bit identification value assigned to a DirectPlay player as part of its participation in a DirectPlay game session.
- **game session**: The metadata associated with the collection of computers participating in a single instance of a computer game.
- **globally unique identifier (GUID)**: A term used interchangeably with universally unique identifier (UUID) in Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the value. Specifically, the use of this term does not imply or require that the algorithms described in

- [RFC4122] or [C706] must be used for generating the **GUID**. See also universally unique identifier (UUID).
- **group**: A collection of **players** within a **game session**. Typically, **players** are placed in a **group** when they serve a common purpose.
- host: In DirectPlay, the computer responsible for responding to DirectPlay game session enumeration requests and maintaining the master copy of all the player and group lists for the game. One computer is designated as the host of the DirectPlay game session. All other participants in the DirectPlay game session are called peers. However, in peer-to-peer mode the name table entry representing the host of the session is also marked as a peer.
- **host migration**: The protocol-specific procedure that occurs when the DirectPlay peer that is designated as the **host** or voice server leaves the **DirectPlay** game or voice session and another **peer** assumes that role.
- **HRESULT**: An integer value that indicates the result or status of an operation. A particular HRESULT can have different meanings depending on the protocol using it. See [MS-ERREF] section 2.1 and specific protocol documents for further details.
- **Internet Protocol version 4 (IPv4)**: An Internet protocol that has 32-bit source and destination addresses. IPv4 is the predecessor of IPv6.
- **Internet Protocol version 6 (IPv6)**: A revised version of the Internet Protocol (IP) designed to address growth on the Internet. Improvements include a 128-bit IP address size, expanded routing capabilities, and support for authentication and privacy.
- **Internetwork Packet Exchange (IPX)**: A protocol that provides connectionless datagram delivery of messages. See [IPX].
- **little-endian**: Multiple-byte values that are byte-ordered with the least significant byte stored in the memory location with the lowest address.
- **modem link (or modem transport)**: Running the **DXDiag** application over a modem-to-modem link. See Also, **serial link**.
- **name table**: The list of systems participating in a **DXDiag**, DirectPlay 4, or **DirectPlay 8** session, as well as any application-created groups.
- name table entry: The DN\_NAMETABLE\_MEMBERSHIP\_INFO structure ([MS-DPDX] section 2.2.33) along with associated strings and data buffers for an individual participant in the DXDiag session. These could be considered players.
- **network byte order**: The order in which the bytes of a multiple-byte number are transmitted on a network, most significant byte first (in big-endian storage). This may or may not match the order in which numbers are normally stored in memory for a particular processor.
- **payload**: The data that is transported to and from the application that is using either the DirectPlay 4 protocol or DirectPlay 8 protocol.
- **peer**: In **DirectPlay**, a player within a DirectPlay game session that has an established connection with every other peer in the game session, and which is not performing game session management duties. The participant that is managing the game session is called the host.
- **peer-to-peer**: A server-less networking technology that allows several participating network devices to share resources and communicate directly with each other.
- **peer-to-peer mode**: A game-playing mode that consists of multiple peers. Each peer has a connection to all other peers in the DirectPlay game session. If there are N peers in the game session, each peer has N-1 connections.

- **player**: A person who is playing a computer game. There can be multiple players on a computer participating in any given game session. See also **name table**.
- **serial link (or serial transport)**: Running the **DXDiag** application over a null modem cable connecting two computers. See also **modem link**.
- service provider: A module that abstracts details of underlying transports for generic DirectPlay message transmission. Each DirectPlay message is transmitted by a DirectPlay service provider. The service providers that shipped with DirectPlay 4 are modem, serial, IPX, and TCP/IP.
- **User Datagram Protocol (UDP):** The connectionless protocol within TCP/IP that corresponds to the transport layer in the ISO/OSI reference model.
- wide characters: Characters represented by a 2-byte value that are encoded using Unicode UTF-16. Unless otherwise stated, no range restrictions apply.
- MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

#### 1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the <a href="Errata"><u>Errata</u></a>.

#### 1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact <a href="mailto:dochelp@microsoft.com">dochelp@microsoft.com</a>. We will assist you in finding the relevant information.

## 1.2.2 Informative References

[MC-DPLHP] Microsoft Corporation, "DirectPlay 8 Protocol: Host and Port Enumeration".

[MC-DPLVP] Microsoft Corporation, "DirectPlay Voice Protocol".

#### 1.3 Overview

The DirectPlay 8 Protocol: Core and Service Providers enables two or more participants to collectively communicate multiplayer **game session** information. The exchange is coordinated by either the server or a **host peer**. The protocol depends on the underlying DirectPlay 8 Protocol: Reliable messaging protocol [MC-DPL8R] to handle connectivity and transport between the clients and the server or host.

## 1.3.1 DirectPlay 8 Protocol: Core and Service Providers Session Management

The DirectPlay 8 Protocol: Core and Service Providers is used to manage the list of clients participating in a **DirectPlay game session**. A designated server or **host peer** owns all changes to that list and coordinates the distribution of information and associated commands to the other clients or peers.

#### 1.3.2 Session Modes

**DirectPlay game sessions** are created in one of two modes: client/server or **peer-to-peer**.

#### 1.3.2.1 Client/Server

**Client/server mode** consists of one server with many client connections (one-to-many). From the perspective of each client, there is only one connection: the connection to the server.

## 1.3.2.2 Peer-to-Peer (Peer/Host)

**Peer-to-peer mode** consists of multiple **peers**. Each peer has a connection to all other peers in the **game session**. If there are N peers in the game session, each peer has N-1 connections.

During a **peer-to-peer** game session, one peer in the game session is considered the **host**. The host is responsible for the synchronization of all other peers in the game session.

## 1.3.3 Connecting to a Session

The DirectPlay 8 Protocol: Core and Service Providers requires that clients first be connected through the DirectPlay 8 Protocol: Reliable (as specified in [MC-DPL8R]). After clients are connected through the DirectPlay 8 Protocol: Reliable, they can then connect to a DirectPlay 8 Protocol: Core and Service Providers multiplayer **game session** as described in section 3.1.

#### 1.3.3.1 Client/Server Connect

Clients attempt to connect to a multiplayer **game session** server by sending a connection request message to the server.

The server attempts to validate the **payload** sent in with the connection request message. If the payload is valid, the server sends a connect information request message. If the server fails to validate the connection request message, the server sends a connection failed message.

Upon receiving an **acknowledgment (ACK)** from the server, the client acknowledges the connection by sending a connection ACK message confirming the connection.

## 1.3.3.2 Peer-to-Peer Connect

The first **peer** in a **DirectPlay game session** is considered the **host** of the multiplayer game session. This host peer waits for additional peers to connect to the DirectPlay game session.

A new peer that wants to connect to the multiplayer game session sends a connection request message.

The host validates the payload sent in and, if it is valid, the host will respond with connection information to the peer.

If the host fails to validate the connection request message, the host sends a connection failed message to the peer.

If the host has successfully validated the connection package, then at the same time it is responding to the connecting peer, the host will also send a message to the other connected **players** indicating that a new player is joining. This informs each existing client that a new peer has joined the game session.

When the connecting peer has received confirmation from the host, it **acknowledges** the connection by sending a message back to the host.

After the host receives the acknowledgment (ACK) message from the newly connected client peer, the host will send a connect instruct message to all existing peers, instructing them to also establish a connection to the new peer. The existing peers will send their unique identifiers to the newly connected peer.

It might be the case that existing peers are unable to connect to the new peer. Existing peers that are unable to connect to the newly connecting peer issue a failure notification back to the host. If the host receives a failure message from any existing peers, the host sends a connection failure message to the peer that is requesting a connection.

## 1.3.4 Disconnecting from a Session

#### 1.3.4.1 Client/Server Disconnect

If the server wants to remove a client from the multiplayer **game session**, it will send a disconnect message to the client. In response, the client is required to disconnect itself from the DirectPlay 8 Protocol: Reliable [MC-DPL8R] game session.

If a client wants to leave a multiplayer game session, it disconnects itself from the DirectPlay 8 Protocol: Reliable game session.

There are no messages specific to the DirectPlay 8 Protocol: Core and Service Providers that a client uses to disconnect itself from a multiplayer game session.

#### 1.3.4.2 Peer-to-Peer Disconnect

If the **host peer** wants to remove a peer from the multiplayer **game session**, the host sends a disconnect message to the peer. In response, the peer disconnects itself from each peer in the multiplayer game session and then disconnects itself from the DirectPlay 8 Protocol: Reliable [MC-DPL8R] game session.

The host also sends a remove **player** message to all other peers in the multiplayer game session to indicate removal of the disconnecting peer. Peers can receive this message before or after the disconnecting peer has disconnected itself from the DirectPlay 8 Protocol: Reliable game session (that is, a peer can receive a remove player message from the host even though the referenced peer has already disconnected from the game session).

If the disconnecting peer is the game session host, **host migration** is performed (as specified in section 1.3.6).

#### 1.3.5 Integrity Check (Peer-to-Peer)

If a client **peer** detects a connection loss to another peer and has not been notified by the **host** that the peer has left, the detecting client peer sends a disconnect notification message to the host to request that the host verify the connection to the possibly disconnected peer.

In response, the host sends an integrity check to the peer that has been reported as disconnected. This message includes an identifier to the requesting peer (the client peer that detected the loss of connection).

Whenever a client peer receives an integrity check message from the host, it responds to the host by sending an integrity check response message.

The integrity check that was sent from the host is sent via a reliable message through the protocol. If the peer in question has dropped, the message will fail to be sent via the protocol, and the **player** will be removed from the **game session**.

If the host receives an integrity check response message from the client peer in question, the host will terminate the requesting peer (the peer that detected a connection loss and questioned the integrity of the other peer) by sending a disconnect message to the requesting peer, removing it from the multiplayer game session.

#### **1.3.6 Host Migration (Peer-to-Peer)**

**Host migration** enables a set of **peer-to-peer** clients to elect a new **host peer** to replace an existing host peer that either drops from the game session, cannot be reached, or is otherwise unavailable. A host peer could become unavailable due to lost connectivity, game session disconnect, or termination.

Host migration is not performed in game sessions that are operating in client/server mode. Only peer-to-peer game sessions can perform host migration.

Host migration is initiated when one or more peer-to-peer clients detects a disconnect with the current host. When this occurs, the current **name table** is referenced to determine the oldest client (the peer that has been connected to the **game session** for the longest time determined by the name table version when the **player** was added to the game session) that is still connected to the game session. This client becomes the new host candidate. Note that there might be more than one host candidate if a game session splits and multiple connections are severed.

The host candidate (or candidates) sends a message to all connected peers. Each peer that receives the message responds to the candidate with a message to provide the client's name table version to the host candidate.

If the host candidate detects a peer with a name table that is newer than the candidate's, the candidate will send a message back to that peer instructing the peer to send the name table operations that are in the peer's name table and not in the candidate's name table.

The peer responds by sending a message back to the host candidate. The message contains the name table operations that are in the peer's name table but not in the host candidate's name table. The host candidate then begins execution against the name table operations that were returned, which in turn will resynchronize all of the players' name tables in the game session.

Once all name table operations have been executed, the host candidate then sends a message to all peers informing them that host migration is complete and that the host candidate is now the game session host.

#### **1.3.7 Groups**

When working with **groups**, be aware of considerations related to **DirectX Diagnostic (DXDiag)**. The DXDiag tool (DxDiag.exe) implementation of this specification does not support groups.

## 1.3.7.1 Client/Server Groups

Although the concept of **groups** exists in a **DirectPlay 8** client/server **game session**, all activity related to groups is handled by the DirectPlay 8 server. There is no network traffic between the client and the server to indicate the existence of a group.

#### 1.3.7.2 Peer-to-Peer Groups

Only the **game session host** can create or modify **groups**. These capabilities include creating and destroying groups along with adding and removing players from groups.

If a non-host peer wants to create a group, it will issue a message to the host requesting that a new group be generated. Once the host has created the new group (via a request from a peer or locally), it issues a message to all the connected peers indicating to them that a new group has been created.

If a non-host peer wants to add a new player to an existing group, it will issue a message to the host requesting that an existing player be added to an existing group. Once the host receives the request and adds the new player to the group (via a peer or locally), the host will send a message to all connected peers indicating to them that a new peer/group matching has been created.

If a non-host peer wants to delete a player from an existing group, it issues a message to the host requesting that a player be removed. Once the host has received the request and has deleted the player from the group (via a peer or locally), the host sends a message to all connected peers letting them know that a peer/group match has been deleted.

If a non-host peer wants to destroy an existing group, it will issue a request to the host. Once the host has received the request and has destroyed the group (via a peer or locally), the host will respond to all connected peers letting them know that a group has been destroyed from the game session.

#### 1.4 Relationship to Other Protocols

DirectPlay 8 Protocol: Core and Service Providers packets are embedded within DirectPlay 8 Protocol: Reliable [MC-DPL8R] packets.

## 1.5 Prerequisites/Preconditions

The DirectPlay 8 Protocol: Core and Service Providers functions only after a DirectPlay 8 Protocol: Reliable [MC-DPL8R] game session is established. If the DirectPlay 8 Protocol: Reliable game session is terminated, the DirectPlay 8 Protocol: Core and Service Providers game session is also terminated.

## 1.6 Applicability Statement

The DirectPlay 8 Protocol: Core and Service Providers is designed to provide a mechanism for managing multiplayer **game sessions** within a DirectPlay 8 Protocol: Reliable [MC-DPL8R] game session.

#### 1.7 Versioning and Capability Negotiation

This specification covers versioning issues in the following areas:

**Supported Transports:** This protocol can be implemented on top of the DirectPlay 8 Protocol: Reliable [MC-DPL8R].

#### 1.8 Vendor-Extensible Fields

This protocol uses **HRESULT** values as specified in [MS-ERREF] section 2.1. Vendors can define their own HRESULT values, provided they set the C bit (0x20000000) for each vendor-defined value, indicating that the value is a customer code.

#### 1.9 Standards Assignments

None.

## 2 Messages

This protocol references commonly used data types as defined in [MS-DTYP].

## 2.1 Transport

The DirectPlay 8 Protocol: Core and Service Providers creates and manages **game sessions** by using the DirectPlay 8 Protocol: Reliable [MC-DPL8R]. The DirectPlay 8 Protocol: Reliable is responsible for managing network connections, sending and receiving packets, and performing reliable communications. All game session messages are sent reliably through the DirectPlay 8 Protocol: Reliable.

Network addresses that are passed to the DirectPlay 8 Protocol: Reliable are used to establish connections via the **DN\_ADDRESSING\_URL** structure (as specified in section 2.2.8).

The data that is passed from the DirectPlay 8 Protocol: Core and Service Providers is passed in the clear to the DirectPlay 8 Protocol: Reliable.

#### 2.1.1 Packet Structure

In regard to a **DirectPlay 8 game session**, all packets are actually embedded within the **data frame** (**DFRAME**) from the protocol. If the **bCommand** field within the DFRAME has the **PACKET\_COMMAND\_USER\_1** flag set, this is a system message that needs to be interpreted. However, if the **PACKET\_COMMAND\_USER\_1** or **PACKET\_COMMAND\_USER\_2** flags are not set, this is data that SHOULD be passed directly to the application.

**Note PACKET\_COMMAND\_USER\_2** is used specifically for DirectPlay Voice Protocol [MC-DPLVP].

#### 2.2 Message Syntax

This protocol specification uses curly braced **GUID** strings as specified in [MS-DTYP] section 2.3.4.3.

## 2.2.1 Connect Messages

## 2.2.1.1 DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO

This is the first message passed into a host/server to initiate the connect sequence.

**Note** <u>DN INTERNAL MESSAGE PLAYER CONNECT INFO EX</u> is an extended version of this packet for DirectPlay 9. If the value of the **dwDNETVersion** field is 7 or greater, the message is DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO\_EX; otherwise, if it is less than 7, the message is DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO. The host/server has to recognize both messages, as clients/peers can send in either type of message depending on the client/peer version.

dwNameSize
dwDataOffset
dwDataSize
dwPasswordOffset
dwPasswordSize
dwConnectDataOffset
dwConnectDataSize
dwURLOffset
dwURLSize
guidInstance (16 bytes)
guidApplication (16 bytes)
url (variable)
connectData (variable)
Password (variable)
data (variable)
name (variable)

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_PLAYER_CONNECT_INFO 0x000000C1	Sends client/peer connection information to the server/host.

dwFlags (4 bytes): A 32-bit field that specifies the connect flags.

Value	Meaning
DP_OBECT_TYPE_CLIENT 0x000000002	Connecting application is a client.
DN_OBJECT_TYPE_PEER 0x000000004	Connecting application is a <b>peer</b> .

dwDNETVersion (4 bytes): A 32-bit field that specifies the DirectPlay version.

Value	Meaning
0x0000001	DirectX 8.0
0x00000002	DirectX 8.1
0x00000003	PocketPC
0x00000004	Not used
0x00000005	Windows Server 2003 operating system
0x00000006	DirectX 8.2

- **dwNameOffset (4 bytes):** A 32-bit field that provides the offset from the end of **dwPacketType** of the connecting application's **name** field. If **dwNameOffset** is 0, the packet does not include name data.
- dwNameSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the data in the name field. If dwNameOffset is set to 0, dwNameSize SHOULD also be 0. If dwNameOffset is not 0, dwNameSize SHOULD also not be 0.
- dwDataOffset (4 bytes): A 32-bit field that specifies the offset from the end of dwPacketType of the data field. If dwNameOffset is 0, the packet does not include application data.
- dwDataSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the data field. If dwDataOffset is set to 0, dwDataSize SHOULD also be 0. If dwDataOffset is not 0, dwDataSize SHOULD also not be 0.
- dwPasswordOffset (4 bytes): A 32-bit field that specifies the offset from the end of dwPacketType of the Password field.
- dwPasswordSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the Password field. If dwPasswordOffset is set to 0, dwPasswordSize SHOULD also be 0. If dwPasswordOffset is not 0, dwPasswordSize SHOULD also not be 0.
- dwConnectDataOffset (4 bytes): A 32-bit field that specifies the offset from the end of dwPacketType of the connectData field. If dwConnectDataOffset is 0, the packet does not include connection data.

- dwConnectDataSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the connectData field. If dwConnectDataOffset is 0, dwConnectDataSize SHOULD also be 0. If dwConnectDataOffset is not 0, dwConnectDataSize SHOULD also not be 0.
- dwURLOffset (4 bytes): A 32-bit field that specifies the offset from the end of dwPacketType to the url field. If dwURLOffset is 0, the packet does not include the client URL. This URL represents the address of the client/peer that is connecting to the game session.
- dwURLSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the url field. If dwURLOffset is 0, dwURLSize SHOULD also be 0. If dwURLOffset is not 0, dwURLSize SHOULD also not be 0.
- quidInstance (16 bytes): A 128-bit field that contains the GUID that identifies the particular instance of the server/host application to which the client/peer is attempting to connect. Each instance of a DirectPlay server/host application generates a new unique GUID each time the application hosts a new game session. In order for the client/peer to connect, the value of quidInstance MUST match the value of the GUID instance defined on the server/host or the value MUST be all zeroes. If a different, nonzero GUID instance value is specified, the recipient MUST send a DN CONNECT FAILED message with the result code DPNERR INVALIDINSTANCE (0x80158380) and terminate the [MC-DPL8R] connection. For information on how a client/peer retrieves the value of the GUID instance defined on the server/host, see the description of the ApplicationInstanceGUID field in the EnumResponse message defined in [MC-DPLHP] section 2.2.2.
- guidApplication (16 bytes): A 128-bit field that specifies the application's assigned GUID. This is the unique identifier for the specific application, not per instance.
- url (variable): A variable-length field that contains a 0-terminated byte character array that specifies the client URL. This field's position is determined by dwURLOffset and the size stated in dwURLSize. It is defined in DN ADDRESSING URL.
- connectData (variable): A variable-length field that contains a byte array that provides the connection data. This field's position is determined by dwConnectDataOffset and the size stated in dwConnectDataSize.
- Password (variable): A variable-length field that contains a 0-terminated wide character array that specifies the application password data. This field's position is determined by dwPasswordOffset and the size stated in dwPasswordSize. This data is passed in clear text to the protocol layer.
- data (variable): A variable-length field that contains a byte array that specifies the application data. This field's position is determined by dwDataOffset and the size stated in dwDataSize.
- name (variable): A variable-length field that contains a 0-terminated wide character array that specifies the client/peer name. This field's position is determined by dwNameOffset and the size stated in dwNameSize.

## 2.2.1.2 DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO\_EX

This is the first message passed into a host/server to initiate the connect sequence.

Note This packet is an extended version of the DN INTERNAL MESSAGE PLAYER CONNECT INFO packet for DirectPlay 9 that includes the dwAlternateAddressDataOffset, dwAlternateAddressDataSize, and alternateAddressData fields. If the value of the

**dwDNETVersion** field is 7 or greater, the message is DN INTERNAL MESSAGE PLAYER CONNECT INFO EX; otherwise, if it is less than 7, the message is

DN INTERNAL MESSAGE PLAYER CONNECT INFO. The host/server has to recognize both messages, as clients/peers can send in either type of message depending on the client/peer version.

connectData (variable)
Password (variable)
data (variable)
name (variable)

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_PLAYER_CONNECT_INFO 0x000000C1	Sends client/peer connection information to the server/host.

dwFlags (4 bytes): A 32-bit field that specifies the connect flags.

Value	Meaning
DP_OBECT_TYPE_CLIENT 0x000000002	Connecting application is a client.
DN_OBJECT_TYPE_PEER 0x00000004	Connecting application is a <b>peer</b> .

dwDNETVersion (4 bytes): A 32-bit field that specifies the DirectPlay version.

Value	Meaning
0x00000007	DirectX 9.0
0x00000008	DirectX 9.0

dwNameOffset (4 bytes): A 32-bit field that provides the offset from the end of dwPacketType of the connecting application's name field. If dwNameOffset is 0, the packet does not include name data.

dwNameSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the data in the name field. If dwNameOffset is set to 0, dwNameSize SHOULD also be 0. If dwNameOffset is not 0, dwNameSize SHOULD also not be 0.

**dwDataOffset (4 bytes):** A 32-bit field that specifies the offset from the end of **dwPacketType** of the **data** field. If **dwNameOffset** is 0, the packet does not include application data.

- dwDataSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the data field. If dwDataOffset is set to 0, dwDataSize SHOULD also be 0. If dwDataOffset is not 0, dwDataSize SHOULD also not be 0.
- **dwPasswordOffset (4 bytes):** A 32-bit field that specifies the offset from the end of **dwPacketType** of the **Password** field.
- **dwPasswordSize (4 bytes):** A 32-bit field that specifies the size, in bytes, of the password. If **dwPasswordOffset** is set to 0, **dwPasswordSize** SHOULD also be 0. If **dwPasswordOffset** is not 0, **dwPasswordSize** SHOULD also not be 0.
- dwConnectDataOffset (4 bytes): A 32-bit field that specifies the offset from the end of dwPacketType of the connectData field. If dwConnectDataOffset is 0, the packet does not include connection data.
- dwConnectDataSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the connectData field. If dwConnectDataOffset is 0, dwConnectDataSize SHOULD also be 0. If dwConnectDataOffset is not 0, dwConnectDataSize SHOULD also not be 0.
- **dwURLOffset (4 bytes):** A 32-bit field that specifies the offset from the end of **dwPacketType** to the **url** field. If **dwURLOffset** is 0, the packet does not include the client URL. This URL represents the address of the client/peer that is connecting to the **game session**.
- dwURLSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the url field. If dwURLOffset is 0, dwURLSize SHOULD also be 0. If dwURLOffset is not 0, dwURLSize SHOULD also not be 0.
- guidInstance (16 bytes): A 128-bit field that contains the GUID that identifies the particular instance of the server/host application to which the client/peer is attempting to connect. Each instance of a DirectPlay server/host application generates a new unique GUID each time the application hosts a new game session. In order for the client/peer to connect, the value of guidInstance MUST match the value of the GUID instance defined on the server/host or the value MUST be all zeroes. If a different, nonzero GUID instance value is specified, the recipient MUST send a DN CONNECT FAILED message with the result code DPNERR\_INVALIDINSTANCE (0x80158380) and terminate the MC-DPL8R connection. For information on how a client/peer retrieves the value of the GUID instance defined on the server/host, see the description of the ApplicationInstanceGUID field in the EnumResponse message defined in MC-DPLHP section 2.2.2.
- **guidApplication (16 bytes):** A 128-bit field that specifies the application's assigned GUID. This is the unique identifier for the specific application, not per instance.
- dwAlternateAddressDataOffset (4 bytes): A 32-bit field that specifies the offset from the end of dwPacketType to the alternateAddressData field. If dwAlternateAddressDataOffset is 0, the packet does not include the alternate address data.
- dwAlternateAddressDataSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the alternateAddressData field. If dwAlternateAddressDataOffset is set to 0, dwAlternateAddressDataSize SHOULD also be 0. If dwAlternateAddressDataOffset is not 0, dwAlternateAddressDataSize SHOULD also not be 0.
- alternateAddressData (variable): A variable-length field that specifies alternative address data used to connect the client. This field's position is determined by dwAlternateAddressDataOffset and the size stated in dwAlternateAddressDataSize. The addresses that are passed into the alternateAddressData field are formatted via the DN ALTERNATE ADDRESS structure. Because DN\_ALTERNATE\_ADDRESS contains its own size, multiple alternate addresses can be passed in by appending the DN\_ALTERNATE\_ADDRESS structures together. However, the maximum number of alternate addresses that can be passed in at a single time is limited to 12.

- url (variable): A variable-length field that contains a 0-terminated byte character array that specifies the client URL. This field's position is determined by dwURLOffset and the size stated in dwURLSize. It is defined in DN ADDRESSING URL.
- connectData (variable): A variable-length field that contains a byte array that provides the connection data. This field's position is determined by dwConnectDataOffset and the size stated in dwConnectDataSize.
- **Password (variable):** A variable-length field that contains a 0-terminated **wide character** array that specifies the application password data. This field's position is determined by **dwPasswordOffset** and the size stated in **dwPasswordSize**. This data is passed in clear text to the protocol layer.
- **data (variable):** A variable-length field that contains a byte array that specifies the application data. This field's position is determined by **dwDataOffset** and the size stated in **dwDataSize**.
- name (variable): A variable-length field that contains a 0-terminated wide character array that specifies the client/peer name. This field's position is determined by dwNameOffset and the size stated in dwNameSize.

## 2.2.1.3 DN\_CONNECT\_FAILED

The DN\_CONNECT\_FAILED packet indicates that a connection attempt failed.

**dwPacketType (4 bytes):** A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_CONNECT_FAILED 0x000000C5	Connection attempt failed.

hResultCode (4 bytes): A 32-bit field that contains the failure code.

Value	Meaning
DPNERR_ALREADYCLOSING 0x80158050	Server/host is closing or host is migrating.
DPNERR_NOTHOST 0x80158530	Attempting to connect to an application that is not the host/server.

Value	Meaning
DPNERR_INVALIDINTERFACE 0x80158390	Nonclient attempting to connect to a server. Nonpeer attempting to connect to a host/peer.
DPNERR_INVALIDVERSION 0x80158460	Version passed in is not a valid <b>DirectPlay</b> version.
DPNERR_INVALIDINSTANCE 0x80158380	Instance <b>GUID</b> is not valid for this <b>game session</b> .
DPNERR_INVALIDAPPLICATION 0x80158300	Application GUID is not valid for this application.
DPNERR_INVALIDPASSWORD 0x80158410	Password passed in does not match what is expected.
DPNERR_HOSTREJECTEDCONNECTION 0x80158260	Application declined connection attempt.
DPNERR_GENERIC 0x80004005	An undetermined error occurred inside a <b>DirectX</b> subsystem. This includes uncommon errors that cannot be generalized.

**dwReplyOffset (4 bytes):** A 32-bit field that specifies the offset from the end of **dwPacketType** to the **reply** field. If **dwReplyOffset** is 0, there is no reply data.

dwReplySize (4 bytes): A 32-bit field that specifies the size, in bytes, of the data in the reply field. If dwReplyOffset is 0, dwReplySize SHOULD also be 0. If dwReplyOffset is not 0, dwReplySize SHOULD also not be 0.

**reply (variable):** A variable-length field that contains an array of bytes that provides a reply message from the application identifying the connection failure. Reply data is only expected when the failure type is **DPNERR\_HOSTREJECTEDCONNECTION**.

## 2.2.1.4 DN\_SEND\_CONNECT\_INFO

The DN\_SEND\_CONNECT\_INFO packet is sent from the host/server indicating to the connecting peer/client that it has joined the **game session**.

dwSessionNameOffset	
dwSessionNameSize	
dwPasswordOffset	
dwPasswordSize	
dwReservedDataOffset	
dwReservedDataSize	
dwApplicationReservedDataOffset	
dwApplicationReservedDataSize	
guidInstance (16 bytes)	
guidApplication (16 bytes)	
dpnid	
dwVersion	
dwVersionNotUsed	
dwEntryCount	
dwMembershipCount	
DN_NameTable_Entry_Info (variable)	
DN_NameTable_Membership_Info (variable)	
URL (variable)	

Data (variable)
Name (variable)
ApplicationReservedData (variable)
ReservedData (variable)
Password (variable)
r assword (variable)
SessionName (variable)
Reply (variable)

dwPacketType (4 bytes): A 32-bit integer that indicates the packet type.

Value	Meaning
DN_MSG_INTERNAL_SEND_CONNECT_INFO 0x0000000C2	The server/host response to a client/peer that contains game session information.

**dwReplyOffset (4 bytes):** A 32-bit field that specifies the offset in bytes from the end of **dwPacketType** of the **reply** field. If **dwReplyOffset** is 0, the packet does not include a reply.

dwReplySize (4 bytes): A 32-bit field that specifies the size, in bytes, of the reply field. If dwReplyOffset is set to 0, dwReplySize MUST be 0. If dwReplyOffset is not 0, dwReplySize MUST NOT be 0.

**dwSize (4 bytes):** A 32-bit field that specifies the size, in bytes, of the application description information. This includes all fields starting with **dwSize** through **guidApplication**.

dwFlags (4 bytes): A 32-bit integer that specifies the application flags.

Value	Meaning
DPNSESSION_CLIENT_SERVER 0x00000001	A client/server game session.
DPNSESSION_MIGRATE_HOST	Host migration is allowed.

Release: April 23, 2024

Value	Meaning
0x00000004	
DPNSESSION_NODPNSVR 0x00000040	The <b>DirectPlay</b> enumeration server is not running.
DPNSESSION_REQUIREPASSWORD 0x00000080	Password is REQUIRED.
DPNSESSION_NOENUMS 0x00000100	No enumerations are allowed from the game session. This value is only available in DirectPlay 9.
DPNSESSION_FAST_SIGNED 0x00000200	Fast signing is turned on for the game session. Passed to protocol layer. Cannot be used with <b>DPNSESSION_FULL_SIGNED</b> . This value is available only in DirectPlay 9.
DPNSESSION_FULL_SIGNED 0x00000400	Full signing turned on for the game session. Passed to protocol layer. Cannot be used with <b>DPNSESSION_FAST_SIGNED</b> . This value is available only in DirectPlay 9.

- **dwMaxPlayers (4 bytes):** A 32-bit integer that specifies the maximum number of clients/peers allowed in the game session. A value of 0 indicates that the maximum number of **players** is not specified.
- **dwCurrentPlayers (4 bytes):** A 32-bit integer that specifies the current number of clients/peers in the game session.
- dwSessionNameOffset (4 bytes): A 32-bit field that specifies the offset in bytes from the end of dwPacketType to the sessionName field. If dwSessionNameOffset is 0, the packet does not include a game session name.
- dwSessionNameSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the sessionName field. If dwSessionNameOffset is 0, dwSessionNameSize MUST be 0. If dwSessionNameOffset is not 0, dwSessionNameSize MUST NOT be 0.
- dwPasswordOffset (4 bytes): A 32-bit field that specifies the offset, in bytes, from the end of dwPacketType to the start of the password. If dwPasswordOffset is 0, the packet does not include a password.
- dwPasswordSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the password. If dwPasswordOffset is 0, dwPasswordSize MUST be 0. If dwPasswordOffset is not 0, dwPasswordSize MUST NOT be 0.
- dwReservedDataOffset (4 bytes): A 32-bit field that specifies the offset, in bytes, from the end of dwPacketType to the reservedData field. If dwReservedDataOffset is 0, the packet does not include reserved data.
- dwReservedDataSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the reservedData field. If dwReservedDataOffset is 0, dwReservedDataSize MUST be 0. If dwReservedDataOffset is not 0, dwReservedDataSize MUST NOT be 0.
- dwApplicationReservedDataOffset (4 bytes): A 32-bit field that specifies the offset, in bytes, from the end of dwPacketType to the applicationReservedData field. If dwApplicationReservedDataOffset is 0, the packet does not include application reserved data.
- dwApplicationReservedDataSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the applicationReservedData field. If dwApplicationReservedDataOffset is 0, dwApplicationReservedDataSize MUST also be 0. If dwApplicationReservedDataOffset is not 0, dwApplicationReservedDataSize MUST NOT be 0.

- guidInstance (16 bytes): A 128-bit field that contains the GUID that identifies the particular instance of the server/host application. The value of this field implicitly SHOULD match the value of the guidInstance field specified in the DN INTERNAL MESSAGE PLAYER CONNECT INFO or DN INTERNAL MESSAGE PLAYER CONNECT INFO EX message, unless that field contained all zeroes, in which case this guidInstance value informs the receiving client of the actual game session instance GUID.
- guidApplication (16 bytes): The application GUID as defined by the host/server.
- **dpnid (4 bytes):** A 32-bit integer created by the server/host that provides the identifier for the new client joining the game session. For more information, see <u>DN DPNID</u>.
- dwVersion (4 bytes): A 32-bit integer that specifies the current name table version.
- dwVersionNotUsed (4 bytes): Not used.
- **dwEntryCount (4 bytes):** A 32-bit integer that provides the number of entries in the name table contained in the <u>DN NAMETABLE ENTRY INFO</u> field below. These are in essence players in the game session.
- **dwMembershipCount (4 bytes):** A 32-bit integer that provides the number of memberships in the name table contained in the <u>DN NAMETABLE MEMBERSHIP INFO</u> field below. These are in essence player to **group** combinations.
- DN\_NameTable\_Entry\_Info (variable): This field contains a variable-length array of DN\_NAMETABLE\_ENTRY\_INFO structures. The length of this array is described above in the dwEntryCount field. Each entry in this array describes a player or group in the game session. In peer-to-peer mode, the host MUST transmit entries for all existing participants and the new participant. In client/server mode, the server MUST transmit only two entries: one for the server player and one for the new participant.
- **DN\_NameTable\_Membership\_Info (variable):** This field contains a variable-length array of DN\_NAMETABLE\_MEMBERSHIP\_INFO structures. The length of this array is described above in the **dwMembershipCount** field. Each entry in this array describes a player/group combination.
- URL (variable): A variable-length field that contains a 0-terminated character array that provides the URL of a user in the game session. This field's position is determined by dwURLOffset and the size stated in dwURLSize, both fields in the corresponding DN\_NAMETABLE\_ENTRY\_INFO structure. There can be multiple instances of the URL field, as defined by the number of DN\_NAMETABLE\_ENTRY\_INFO sections that are included.
- **Data (variable):** A variable-length field that contains a 0-terminated character array that specifies the user data. This field's position is determined by **dwDataOffset** and the size stated in **dwDataSize**, both fields in the corresponding DN\_NAMETABLE\_ENTRY\_INFO structure. There can be multiple instances of the Data field, as defined by the number of DN\_NAMETABLE\_ENTRY\_INFO sections that are included.
- Name (variable): A variable-length field that contains a 0-terminated wide character array that contains the client name. This field's position is determined by dwNameOffset and the size stated in dwNameSize, both fields in the corresponding DN\_NAMETABLE\_ENTRY\_INFO structure. There can be multiple instances of the Name field, as defined by the number of DN\_NAMETABLE\_ENTRY\_INFO sections that are included.
- **ApplicationReservedData (variable):** A variable-length field that contains a 0-terminated character array that specifies the application reserved data. This field's position is determined by **dwApplicationReservedDataOffset** and the size stated in **dwApplicationReservedDataSize**.
- **ReservedData (variable):** A variable-length field that contains a byte array that provides the reserved data. This field's position is determined by **dwReservedDataOffset** and the size stated in **dwReservedDataSize**.

**Password (variable):** A variable-length field that contains a 0-terminated wide character array that specifies the application password data. This field's position is determined by **dwPasswordOffset** and the size stated in **dwPasswordSize**. This data is passed in clear text to the protocol layer.

**SessionName (variable):** A variable-length field that contains a 0-terminated wide character array that specifies the game session name. This field's position is determined by **dwSessionNameOffset** and the size stated in **dwSessionNameSize**.

**Reply (variable):** A variable-length field that contains a byte array that provides the reply. This field's position is determined by **dwReplyOffset** and the size stated in **dwReplySize**.

## 2.2.1.5 DN\_NAMETABLE\_ENTRY\_INFO

The DN\_NAMETABLE\_ENTRY\_INFO contains a **player** or **group** that exists in a **DirectPlay 8 name table**. This includes all the information that the DirectPlay 8 Protocol: Core and Service Providers would need about a certain entry.

**dpnid (4 bytes):** A 32-bit integer that specifies the **DirectPlay** identifier (**DPNID**) of the player or group that has been defined by the host/server. For more information about DPNIDs, see section 2.2.7.

dpnidOwner (4 bytes): A 32-bit integer that provides the DirectPlay identifier (DPNID) for the owner of the player or group. When the DN\_NAMETABLE\_ENTRY\_INFO message represents a group, that is, NAMETABLE\_ENTRY\_FLAG\_GROUP is set in the dwFlags field, the dpnidOwner field MUST be nonzero. When DN\_NAMETABLE\_ENTRY\_INFO represents a player, dpnidOwner SHOULD be set to zero when sending and MUST be ignored on receipt. For more information about DPNIDs, see section 2.2.7.

**dwFlags (4 bytes):** A 32-bit integer that specifies the **name table entry** flags. Entries are OR'd together.

Value	Meaning
NAMETABLE_ENTRY_FLAG_LOCAL 0x00000001	The name table entry is the local player.
NAMETABLE_ENTRY_FLAG_HOST 0x00000002	The name table entry is the host.
NAMETABLE_ENTRY_FLAG_ALL_PLAYERS_GROUP 0x00000004	The name table entry is the All Players Group.
NAMETABLE_ENTRY_FLAG_GROUP 0x00000010	The name table entry is a group.
NAMETABLE_ENTRY_FLAG_GROUP_AUTODESTRUCT 0x00000040	The name table entry supports group autodestruct.
NAMETABLE_ENTRY_FLAG_PEER 0x00000100	The name table entry is a peer. In peer-to-peer mode, the name table entry representing the host of the game session is also marked as a peer.
NAMETABLE_ENTRY_FLAG_CLIENT 0x00000200	The name table entry is a client.
NAMETABLE_ENTRY_FLAG_SERVER 0x00000400	The name table entry is a server.
NAMETABLE_ENTRY_FLAG_CONNECTING 0x00001000	The name table entry is connecting.
NAMETABLE_ENTRY_FLAG_AVAILABLE 0x00002000	The name table entry is to make the member available for use.
NAMETABLE_ENTRY_FLAG_DISCONNECTING 0x00004000	The name table entry to indicate disconnecting.
NAMETABLE_ENTRY_FLAG_INDICATED 0x00010000	The name table entry to indicate connection to the application.
NAMETABLE_ENTRY_FLAG_CREATED 0x00020000	The name table entry to indicate the application was given a created player.
NAMETABLE_ENTRY_FLAG_NEED_TO_DESTROY 0x00040000	The name table entry to indicate the need to destroy the player.
NAMETABLE_ENTRY_FLAG_IN_USE 0x00080000	The name table entry to indicate that the player is in use.

dwVersion (4 bytes): A 32-bit integer that specifies the version number of the name table.

dwVersionNotUsed (4 bytes): Not used.

dwDNETVersion (4 bytes): A 32-bit integer that provides the DirectPlay version.

Value	Meaning
0x00000001	DirectX 8.0
0x00000002	DirectX 8.1
0x00000003	PocketPC
0x00000004	Not used.
0x00000005	Windows Server 2003
0x00000006	DirectX 8.2
0x00000007	DirectX 9.0
0x00000008	DirectX 9.0

**dwNameOffset (4 bytes):** The offset, in bytes, from the end of **dwPacketType** to the **name** field. (Defined in <u>DN SEND CONNECT INFO</u>). If **dwNameOffset** is 0, there is not a name.

dwNameSize (4 bytes): The size, in bytes, of the name field. (Specified in section 2.2.1.4). If dwNameOffset is 0, dwNameSize SHOULD also be 0. If dwNameOffset is not 0, dwNameSize SHOULD also not be 0.

dwDataOffset (4 bytes): The offset, in bytes, from the end of dwPacketType to the data field. If dwDataOffset is 0, there is no additional data.

**dwDataSize (4 bytes):** The size, in bytes, of the **data** field. If **dwDataOffset** is 0, **dwDataSize** SHOULD also be 0. If **dwDataOffset** is not 0, **dwDataSize** SHOULD also not be 0.

**dwURLOffset (4 bytes):** The offset, in bytes, from the end of **dwPacketType** to the **url** field. Specified in section 2.2.8).

dwURLSize (4 bytes): The size, in bytes, of the url field.

## 2.2.1.6 DN\_NAMETABLE\_MEMBERSHIP\_INFO

The DN\_NAMETABLE\_MEMBERSHIP\_INFO structure contains information about a **name table's group** and **player** memberships. The number of DN\_NAMETABLE\_MEMBERSHIP\_INFO structures in this packet is specified in the **dwMembershipCount** field.

**dpnidPlayer (4 bytes):** A 32-bit integer that specifies the **DirectPlay** identifier for the user. For more information, see section 2.2.7.

**dpnidGroup (4 bytes):** A 32-bit integer that provides the DirectPlay identifier for the group. For more information, see section 2.2.7.

dwVersion (4 bytes): A 32-bit integer that specifies the name table version.

dwVersionNotUsed (4 bytes): Not used.

## 2.2.1.7 DN\_ADD\_PLAYER (Peer-to-Peer Mode Only)

The DN\_ADD\_PLAYER packet is sent from the **host** and instructs **peers** to add a specified peer to the **game session**.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_ADD_PLAYER 0x000000000	Instructs peers to add the specified peer to the game session.

**dpnid (4 bytes):** A 32-bit field that contains the identifier of the peer to add. For more information, see section 2.2.7.

**dpnidOwner (4 bytes):** A 32-bit field that contains the identifier of the game session owner. For more information, see section 2.2.7.

dwFlags (4 bytes): A 32-bit field that contains player flags.

Value	Meaning
NAMETABLE_ENTRY_FLAG_LOCAL 0x00000001	name table entry is the local player.
NAMETABLE_ENTRY_FLAG_HOST 0x00000002	Name table entry is the host.
NAMETABLE_ENTRY_FLAG_ALL_PLAYERS_GROUP 0x00000004	Name table entry is the All Players Group.
NAMETABLE_ENTRY_FLAG_GROUP 0x00000010	Name table entry is a group.
NAMETABLE_ENTRY_FLAG_GROUP_AUTODESTRUCT 0x00000040	Name table entry supports group autodestruct.
NAMETABLE_ENTRY_FLAG_PEER 0x00000100	Name table entry is a peer.
NAMETABLE_ENTRY_FLAG_CLIENT 0x00000200	Name table entry is a client.
NAMETABLE_ENTRY_FLAG_SERVER 0x00000400	Name table entry is a server.
NAMETABLE_ENTRY_FLAG_CONNECTING 0x00001000	Name table entry is connecting.
NAMETABLE_ENTRY_FLAG_AVAILABLE 0x00002000	Name table entry is to make member available for use.
NAMETABLE_ENTRY_FLAG_DISCONNECTING 0x00004000	Name table entry to indicate disconnecting.
NAMETABLE_ENTRY_FLAG_INDICATED 0x00010000	Name table entry to indicate connection to an application.
NAMETABLE_ENTRY_FLAG_CREATED 0x00020000	Name table entry to indicate that the application was given the created player.
NAMETABLE_ENTRY_FLAG_NEED_TO_DESTROY 0x00040000	Name table entry to indicate that the game session owner needs to destroy a player.
NAMETABLE_ENTRY_FLAG_IN_USE	Name table entry to indicate that the player is in use.

Value	Meaning
0x00080000	

dwVersion (4 bytes): A 32-bit field that specifies the current name table version number.

dwVersionNotUsed (4 bytes): Not used.

**dwDNETClientVersion (4 bytes):** A 32-bit field that contains the **DirectPlay** version of the client being added to the game session.

Value	Meaning
0x00000001	DirectX 8.0
0x00000002	DirectX 8.1
0x00000003	PocketPC
0x00000004	Not used
0x00000005	Windows Server 2003
0x00000006	DirectX 8.2
0x00000007	DirectX 9.0
0x00000008	DirectX 9.0

- **dwNameOffset (4 bytes):** A 32-bit field that contains the offset from the end of **dwPacketType** to the peer name. If this field is 0, the packet does not include the peer name.
- dwNameSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the name. If dwNameOffset is 0, dwNameSize SHOULD also be 0. If dwNameOffset is not 0, dwNameSize SHOULD also not be 0.
- **dwDataOffset (4 bytes):** A 32-bit field that contains the offset from the end of **dwPacketType** to peer data. If this field is 0, the packet does not include peer data.
- dwDataSize (4 bytes): A 32-bit field that specifies the size, in bytes, of the peer data. If dwDataOffset is 0, dwDataSize SHOULD also be 0. If dwDataOffset is not 0, dwDataSize SHOULD also not be 0.
- **dwURLOffset (4 bytes):** A 32-bit field that contains the offset from the end of **dwPacketType** to the peer URL.
- **dwURLSize (4 bytes):** A 32-bit field that specifies the size, in bytes, of the connecting peer's URL address.
- url (variable): A variable-length field that contains an array of characters that specify the client URL.
- data (variable): A variable-length field that specifies a byte array of characters that contain user data.
- **name (variable):** A variable-length field that specifies an array of **wide characters** that contain the peer name including the NULL termination character.

## 2.2.1.8 DN\_ACK\_CONNECT\_INFO

The DN\_ACK\_CONNECT\_INFO packet is sent from the client/peer to the server/host to **acknowledge** the receipt of connection information. This packet contains no user data beyond the packet type field.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_ACK_CONNECT_INFO 0x000000C3	Acknowledges (ACK) the receipt of <b>game session</b> information.

## 2.2.1.9 DN\_INSTRUCT\_CONNECT

The DN\_INSTRUCT\_CONNECT packet instructs a peer to connect to a designated peer. This packet uses the CONNECT and CONNECTED packets defined in [MC-DPL8R] sections 2.2.1.1 and 2.2.1.2. For an example of the message sequence for these packets, see [MC-DPL8R] section 4.1.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_INSTRUCT_CONNECT 0x000000C6	Instructs a peer to connect to a designated peer.

**dpnid (4 bytes):** A 32-bit field that contains the identifier of the designated client to which the connection is being made. For more information, see section 2.2.7.

dwVersion (4 bytes): A 32-bit field that contains the current version of the name table.

dwVersionNotUsed (4 bytes): Not used.

## 2.2.1.10 DN\_SEND\_PLAYER\_DPNID

The DN\_SEND\_PLAYER\_DPNID packet is used to send a user identification number to another client.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning	
DN_MSG_INTERNAL_SEND_PLAYER_DNID 0x000000C4	Sends user identification to another client/peer.	

**dpnID** (4 bytes): A 32-bit field that contains the identifier of the client/peer. For more information, see section 2.2.7.

## 2.2.1.11 DN\_INSTRUCTED\_CONNECT\_FAILED

The DN\_INSTRUCTED\_CONNECT\_FAILED packet is sent from a peer to indicate that it was unable to carry out a host instruction to connect to a new peer.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_INSTRUCTED_CONNECT_FAILED 0x000000C7	Indicates that a peer was unable to carry out a host's instruction to connect to a new peer.

**dpnID (4 bytes):** A 32-bit field that contains the identifier for the peer to which the attempted connection failed. For more information, see section 2.2.7.

## 2.2.1.12 DN\_CONNECT\_ATTEMPT\_FAILED

The DN\_CONNECT\_ATTEMPT\_FAILED packet is sent from the **host** to a connecting **peer** to indicate that an existing peer in the **game session** was unable to carry out the host's instruction to connect to a new peer.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_CONNECT_ATTEMPT_FAILED 0x000000C8	Indicates from the host that an existing peer was unable to carry out the host's instruction to connect to a new peer.

**dpnID (4 bytes):** A 32-bit field that contains the identifier for the existing peer in the game session that was unable to connect to the new peer. For more information, see section 2.2.7.

#### 2.2.2 Disconnect Messages

## 2.2.2.1 DN\_TERMINATE\_SESSION

The DN\_TERMINATE\_SESSION packet instructs the client or the **peer** to disconnect from the **game session**.

**dwPacketType (4 bytes):** A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_TERMINATE_SESSION 0x000000DF	Instructs the client or the peer to close and disconnect itself from the game session.

**dwTerminateDataOffset (4 bytes):** A 32-bit field that contains the offset from the end of **dwPacketType** for the data passed from the server/host application that describes why the client or the peer is being terminated.

dwTerminateDataSize (4 bytes): A 32-bit field that contains the size, in bytes, of the terminate data. If dwTerminateDataOffset is 0, dwTerminateDataSize SHOULD also be 0. If dwTerminateDataOffset is not 0, dwTerminateDataSize SHOULD also not be 0.

**TerminateData (variable):** A variable-length field that contains a byte array from the application that describes why the client or the peer is being terminated from the game session.

## 2.2.2.2 DN\_DESTROY\_PLAYER

The DN\_DESTROY\_PLAYER packet instructs the **peer** to remove a specified user from its **name table**.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_DESTROY_PLAYER 0x000000D1	Instructs the peer to remove the specified peer from the name table.

**dpnidLeaving (4 bytes):** A 32-bit field that contains the identifier of the client or server to remove from the name table. For more information, see section <u>2.2.7</u>.

dwVersion (4 bytes): A 32-bit field that contains the current name table version number.

dwVersionNotUsed (4 bytes): Not used.

**dwDestroyReason (4 bytes):** A 32-bit field that contains the reason for terminating the specified client or server.

Value	Meaning
DPNDESTROYPLAYERREASON_NORMAL 0x0001	Peer/host is leaving.
DPNDESTROYPLAYERREASON_CONNECTIONLOST 0x0002	Connection to peer was lost.
DPNDESTROYPLAYERREASON_SESSIONTERMINATED 0x0003	Game session was terminated.
DPNDESTROYPLAYERREASON_HOSTDESTROYEDPLAYER 0x0004	Host removed the peer.

## 2.2.2.3 DN\_HOST\_MIGRATE

The DN\_HOST\_MIGRATE packet is sent from the new **host** to all remaining **peers** in the **game session** to notify them that a migration is taking place.

Release: April 23, 2024

dpnidOldHost	
dpnidNewHost	

**dwPacketType (4 bytes):** A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_HOST_MIGRATE 0x000000CD	Notified peers in the game session that the host is currently migrating.

**dpnidOldHost (4 bytes):** A 32-bit field that contains the identifier for the host that has just disconnected. For more information, see section 2.2.7.

**dpnidNewHost (4 bytes):** A 32-bit field that contains the identifier for the newly assigned host that is in the process of migrating. For more information, see section 2.2.7.

## 2.2.2.4 DN\_NAMETABLE\_VERSION

The DN\_NAMETABLE\_VERSION packet specifies the version number of the **name table**.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_NAMETABLE_VERSION	Specifies the version number of the name table.
0x000000C9	

dwVersion (4 bytes): A 32-bit field that contains the current name table version number.

dwVersionNotUsed (4 bytes): Not used.

#### 2.2.2.5 DN\_RESYNC\_VERSION

The DN\_RESYNC\_VERSION packet is used to request that the **name table** version number be resynchronized to the current version number.

#### dwVersionNotUsed

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_RESYNC_VERSION 0x000000CA	Requests that the name table version number be resynchronized to the current version number.

dwVersion (4 bytes): A 32-bit field that contains the current name table version number.

dwVersionNotUsed (4 bytes): Not used.

### 2.2.2.6 DN\_REQ\_INTEGRITY\_CHECK

The DN\_REQ\_INTEGRITY\_CHECK packet requests that a host determine whether a target client is still in the game session.

**dwPacketType (4 bytes):** A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_REQ_INTEGRITY_CHECK 0x0000000E2	Requests that the host determine whether a target peer is still in the game session.

dwReqContext (4 bytes): A 32-bit field that contains the context for the request operation. Values for the **dwReqContext** field SHOULD be ignored by the recipient.

dpnidTarget (4 bytes): A 32-bit field that contains the identifier of the selected target peer for the host to validate. For more information, see section 2.2.7.

# 2.2.2.7 DN\_INTEGRITY\_CHECK

The DN\_INTEGRITY\_CHECK packet is a request from a host to a peer inquiring whether the peer is still in the game session.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_INTEGRITY_CHECK 0x0000000E3	Host is requesting a peer to validate that it is still in the game session.

**dpnidRequesting (4 bytes):** A 32-bit field that contains the identifier of the **peer** requesting this validation. For more information, see section <u>2.2.7</u>.

# 2.2.2.8 DN\_INTEGRITY\_CHECK\_RESPONSE

The DN\_INTEGRITY\_CHECK\_RESPONSE packet is a response from a peer to the host confirming that it is still in the **game session**.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_INTEGRITY_CHECK 0x0000000E4	Host is requesting a peer to validate that it is still in the game session.

**dpnidRequesting (4 bytes):** Identifier of the peer that requested the validation. For more information, see section 2.2.7.

## 2.2.2.9 DN\_REQ\_NAMETABLE\_OP

The DN\_REQ\_NAMETABLE\_OP packet is sent from the new **host** to a **peer** with a newer **name table** to request that the peer send back name table operations that have not yet been performed on the host. If no newer name table exists, this message is not sent.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_REQ_NAMETABLE_OP 0x000000CB	Sent from the host after a migration requesting the name table from a peer with a newer name table, if any exists.

dwVersion (4 bytes): A 32-bit field that contains the current name table version number of the host.

# 2.2.2.10 DN\_ACK\_NAMETABLE\_OP

The DN\_ACK\_NAMETABLE\_OP packet is sent from the **peer** that is being queried for **name table** information back to the new **host**. It will include all entries missing from the new host's name table.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_REQ_NAMETABLE_OP 0x000000CC	Sent from the peer to the new host, acknowledging the new name table information.

**dwNumEntries (4 bytes):** A 32-bit field that contains the number of name table entries included. The **dwMsgId**, **dwOpOffset**, **dwOpSize**, and **op** fields are present in a DN\_ACK\_NAMETABLE\_OP message **dwNumEntries** times.

**dwMsgId (4 bytes):** A 32-bit field that contains the internal message for the given **name table entry**.

Value	Meaning
0x000000C6	DN_INSTRUCT_CONNECT (section 2.2.1.9)
0x000000D0	DN_ADD_PLAYER (section 2.2.1.7)
0x000000D1	DN_DESTROY_PLAYER (section 2.2.2.2)
0x00000D7	DN_CREATE_GROUP (section 2.2.4.2)
0x000000D8	DN_DESTROY_GROUP (section 2.2.4.8)
0x000000D9	DN_ADD_PLAYER_TO_GROUP (section 2.2.4.4)
0x00000DA	DN_DELETE_PLAYER_FROM_GROUP (section 2.2.4.6)
0x000000DB	DN_UPDATE_INFO (section 2.2.5.2)

**dwOpOffset (4 bytes):** A 32-bit field that contains the offset from end of **dwPacketType** for the given operation buffer.

dwOpSize (4 bytes): A 32-bit field that contains the size for the given operation buffer.

op (4 bytes): A variable length field that contains the portion of the packet originally associated with the name table operation, except for the dwPacketType field, as indicated by the dwMsgId field. Each operation buffer is atomic to itself. For example, an **op** value corresponding to a dwMsqId field value of 0x000000D1 would contain the dpnidLeaving, dwVersion, dwVersionNotUsed, and dwDestroyReason field information from an original DN DESTROY PLAYER packet.

#### 2.2.2.11 DN\_HOST\_MIGRATE\_COMPLETE

The DN HOST MIGRATE COMPLETE packet informs peers that the session-hosting responsibilities have successfully migrated from the departing old host.

**dwPacketType (4 bytes):** A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_HOST_MIGRATE_COMPLETE 0x000000CE	Informs peers that the session-hosting responsibilities have successfully migrated from the departing old host.

# 2.2.3 Send/Receive Messages

There are two different types of user sends:

**Normal:** The sender does not care whether the receiving application actually received the message. In this case, the DN SEND DATA message is used.

Requested Completion: The sender REQUIRES confirmation that the message was delivered to the receiving application.

Note "Delivered to the receiving application" means that the message has been delivered to the application layer, not simply obtained by the receiver's machine. In this case, the DN REQ PROCESS COMPLETION message is used.

#### 2.2.3.1 DN\_SEND\_DATA

The DN\_SEND\_DATA message is sent from one player to another player when the sending player's application does not require confirmation from the receiving player's application that the sent data has been consumed.

**payload (variable):** A variable-length field that contains the application data that is passed from one application to another.

# 2.2.3.2 DN\_REQ\_PROCESS\_COMPLETION

The DN\_REQ\_PROCESS\_COMPLETION message is sent from one **player** to another player when the sending player's application wants confirmation regarding when the sent data has been consumed by the receiving player's application.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_REQ_PROCESS_COMPLETION 0x000000E0	Used to inform the receiving application that the sending application is requesting delivery verification.

**dwPacketContext (4 bytes):** A 32-bit field that contains the system identifier for this action.

<u>DN PROCESS COMPLETION</u> needs to respond to this message in the identical manner in which it was passed.

**payload (variable):** A variable-length field that contains the application data passed from one player to another.

# 2.2.3.3 DN\_PROCESS\_COMPLETION

The DN\_PROCESS\_COMPLETION message is returned to the **peer** that sent the data after the sent **payload** has been consumed.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_PROCESS_COMPLETION 0x0000000E1	Informs the sender that the payload data has been consumed.

**dwPacketContext (4 bytes):** A 32-bit field that contains the system identifier for this action. The response to this message SHOULD include this context in the identical manner as it was sent.

# 2.2.4 Group Messages (Peer-to-Peer Mode Only)

**Note** When working with **groups**, be aware of considerations related to **DirectX Diagnostic** (**DXDiag**). The DXDiag tool (DxDiag.exe) implementation of this specification does not support groups.

# 2.2.4.1 DN\_REQ\_CREATE\_GROUP

The DN\_REQ\_CREATE\_GROUP packet informs the **host** that a **peer** is requesting that a new **group** be created for the **game session**.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_REQ_CREATE_GROUP 0x000000D2	Informs the host that a peer is requesting that a new group be created in the game session.

**dwPacketContext (4 bytes):** A 32-bit field that contains the system identifier for this action. DN\_CREATE\_GROUP (see section <u>2.2.4.2</u>) SHOULD respond to this message in the identical manner in which it was passed.

**dwGroupFlags (4 bytes):** A 32-bit field that contains the flags passed in on creation of a group, indicating certain behavior.

Value	Meaning
DPNGROUP_AUTODESTRUCT 0x00000001	Informs the host that the group SHOULD be deleted once all players have been removed.

**dwInfoFlags (4 bytes):** A 32-bit field that contains the flags passed in specifying the data that is to be updated with this request.

Value	Meaning
DPNINFO_NAME 0x00000001	Indicates whether a name is included with this packet.
DPNINFO_DATA 0x00000002	Indicates whether data is included with this packet.

- **dwNameOffset (4 bytes):** A 32-bit field that contains the offset from the end of **dwPacketType** of the **name** field for the group. If **dwNameOffset** is 0, the packet does not include name data.
- dwNameSize (4 bytes): A 32-bit field that contains the size, in bytes, of the data in the name field. If dwNameOffset is set to 0, dwNameSize SHOULD also be 0. If dwNameOffset is not 0, dwNameSize SHOULD also not be 0.
- **dwDataOffset (4 bytes):** A 32-bit field that contains the offset from the end of **dwPacketType** of the **data** field. If **dwDataOffset** is 0, the packet does not include application data.
- dwDateSize (4 bytes): A 32-bit field that contains the size, in bytes, of the data field. If dwDataOffset is set to 0, dwDataSize SHOULD also be 0. If dwDataOffset is not 0, dwDataSize SHOULD also not be 0.
- **data (variable):** A variable-length field that contains the byte array that specifies the application data. This field's position is determined by **dwDataOffset** and the size stated in **dwDataSize**.
- name (variable): A variable-length field that contains the zero-terminated wide character array that provides the group name. This field's position is determined by dwNameOffset and the size stated in dwNameSize.

# 2.2.4.2 DN\_CREATE\_GROUP

The DN\_CREATE\_GROUP packet informs all of the connected **peers** that the new **group** has been successfully created for the **game session**.

**dwPacketType (4 bytes):** A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_CREATE_GROUP 0x000000D7	Informs the requesting peer that the group has been created.

dpnidRequesting (4 bytes): A 32-bit field that contains the DPNID of the peer that has requested the group to be created. For more information, see section 2.2.7.

dwPacketContext (4 bytes): A 32-bit field that contains the value sent in with the DN REQ CREATE GROUP from the requesting peer. The value passed MUST be identical to that which was passed in.

### 2.2.4.3 DN\_REQ\_ADD\_PLAYER\_TO\_GROUP

The DN REQ ADD PLAYER TO GROUP packet informs the host that a peer is requesting that a new player be added to an existing group.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_REQ_ADD_PLAYER_TO_GROUP 0x000000D3	Informs the host that a peer is requesting to add a player to an existing group in the game session.

dwPacketContext (4 bytes): A 32-bit field that contains the context value passed in for this operation. It MUST be passed in exactly with **DN ADD PLAYER TO GROUP**.

dpnidGroup (4 bytes): A 32-bit field that contains the group that the peer is asking the new player be added to. For more information, see section 2.2.7.

dpnidPlayer (4 bytes): A 32-bit field that contains the identifier of the player that is being added to the existing group. For more information, see section 2.2.7.

# 2.2.4.4 DN\_ADD\_PLAYER\_TO\_GROUP

The DN\_ADD\_PLAYER\_TO\_GROUP packet informs the peers that a player has been added to an existing group.

dpnidGroup	
dpnidPlayer	
dwVersion	
dwVersionNotUsed	
dpnidRequesting	
dwPacketContext	

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_ADD_PLAYER_TO_GROUP 0x000000D9	Informs the peers that the host has added a player in a game session to a group.

**dpnidGroup (4 bytes):** A 32-bit field that contains the group to which the peer has been added. For more information, see section 2.2.7.

**dpnidPlayer (4 bytes):** A 32-bit field that contains the identifier of the peer that has been added to the group. For more information, see section 2.2.7.

dwVersion (4 bytes): A 32-bit integer that specifies the current name table version.

dwVersionNotUsed (4 bytes): Not used.

**dpnidRequesting (4 bytes):** A 32-bit field that contains the identifier of the peer that has requested the host to add a peer to a group. For more information, see section 2.2.7.

dwPacketContext (4 bytes): A 32-bit field that contains the context value passed in for this operation. The value MUST be passed in exactly as it was received in <u>DN REQ ADD PLAYER TO GROUP</u>.

# 2.2.4.5 DN\_REQ\_DELETE\_PLAYER\_FROM\_GROUP

The DN\_REQ\_DELETE\_PLAYER\_FROM\_GROUP packet informs the **host** that a **peer** is requesting a **player** be removed from an existing **group**.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_REQ_DELETE_PLAYER_FROM_GROUP 0x000000D4	Informs the host that a peer is requesting to add a player in a game session to a group.

**dwPacketContext (4 bytes):** A 32-bit field that contains the context value passed in for this operation. The value MUST be passed in exactly with <u>DN\_DELETE\_PLAYER\_FROM\_GROUP</u>.

**dpnidGroup (4 bytes):** A 32-bit field that contains the group from which the peer is asking to have the player removed. For more information, see section 2.2.7.

**dpnidPlayer (4 bytes):** A 32-bit field that contains the identifier of the player that is being removed from the group. For more information, see section 2.2.7.

# 2.2.4.6 DN\_DELETE\_PLAYER\_FROM\_GROUP

The DN\_DELETE\_PLAYER\_FROM\_GROUP packet informs the **peers** that a **player** has been removed from a **group**.

**dwPacketType (4 bytes):** A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_DELETE_PLAYER_FROM_GROUP 0x000000DA	Informs the peers that the host has removed a player in a game session from a group.

**dpnidGroup (4 bytes):** A 32-bit field that contains the group that has removed the player. For more information, see section 2.2.7.

**dpnidPlayer (4 bytes):** A 32-bit field that contains the identifier of the player that was removed from the group. For more information, see section 2.2.7.

dwVersion (4 bytes): A 32-bit integer that specifies the current name table version.

dwVersionNotUsed (4 bytes): Not used.

**dpnidRequesting (4 bytes):** A 32-bit field that contains the identifier of the peer that has requested the host to remove a player from a group. For more information, see section 2.2.7.

**dwPacketContext (4 bytes):** A 32-bit field that contains the context value passed in for this operation. The value MUST be passed in exactly as it was received in DN REO DELETE PLAYER FROM GROUP.

# 2.2.4.7 DN\_REQ\_DESTROY\_GROUP

The DN\_REQ\_DESTROY\_GROUP packet informs the **host** that a **peer** is requesting that a **group** be deleted from the **game session**.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_REQ_DESTROY_GROUP 0x000000D5	Informs the host that a peer is requesting that a group be deleted from the game session.

**dwPacketContext (4 bytes):** A 32-bit field that contains the context value passed in for this operation. The value MUST be passed in exactly with <a href="DN DESTROY GROUP">DN DESTROY GROUP</a>.

**dpnidGroup (4 bytes):** A 32-bit field that contains the group from which the peer is asking to have the player removed. For more information, see section 2.2.7.

**dpnidPlayer (4 bytes):** A 32-bit field that contains the identifier of the player that is being removed from the group. For more information, see section 2.2.7.

#### 2.2.4.8 DN DESTROY GROUP

The DN\_DESTROY\_GROUP packet informs the **peers** that a **group** has been removed from a **game session**.

#### dwPacketContext

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_DESTROY_GROUP 0x000000D8	Informs the peers that the host has removed a group from the game session.

**dpnidGroup (4 bytes):** A 32-bit field that contains the group that has been destroyed. For more information, see section <u>2.2.7</u>.

dwVersion (4 bytes): A 32-bit integer that specifies the current name table version.

dwVersionNotUsed (4 bytes): Not used.

**dpnidRequesting (4 bytes):** A 32-bit integer identifying the peer that has requested the host to delete a group. For more information, see section 2.2.7.

**dwPacketContext (4 bytes):** A 32-bit field that contains the context value passed in for this operation. The value MUST be passed in exactly as it was received in <u>DN\_REQ\_DESTROY\_GROUP</u>.

# 2.2.5 Update Information

# 2.2.5.1 DN\_REQ\_UPDATE\_INFO

The DN\_REQ\_UPDATE\_INFO message is sent from a peer/client to the host/server to update information about a specified peer/client in the **game session**.

0 1 2 3 4 5 6 7 8 9 0	1 2 3 4	5 6 7 8	8 9 0	1 2	2 3	4 5	6	7	8	9	3	1
	dwP	PacketType										
	dwPa	cketContext	t									
		dpnid										
	dw	InfoFlags										
	dwN	lameOffset										
dwNameSize												
dwDataOffset												
dwDataSize												
data (variable)												
		•••										

name (variable)	

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_REQ_UPDATE_INFO 0x000000D6	Update info request from a peer/client to the host/server.

- **dwPacketContext (4 bytes):** A 32-bit field that contains the context value passed in for this operation. The value MUST be passed in exactly with <a href="DN UPDATE INFO">DN UPDATE INFO</a>.
- **dpnid (4 bytes):** A 32-bit field that contains the identifier for the peer/client to have update information. For more information, see section <u>2.2.7</u>.
- **dwInfoFlags (4 bytes):** A 32-bit field that contains the flags passed in specifying the data fields that are to be updated with this request.

Value	Meaning
DPNINFO_NAME 0x00000001	Indicates whether a name is included with this packet.
DPNINFO_DATA 0x00000002	Indicates whether data is included with this packet.

- **dwNameOffset (4 bytes):** A 32-bit field that contains the offset from the end of **dwPacketType** of the **name** field for the dpnid. If **dwNameOffset** is 0, the packet does not include name data.
- dwNameSize (4 bytes): A 32-bit field that contains the size, in bytes, of the data in the name field. If dwNameOffset is set to 0, dwNameSize SHOULD also be 0. If dwNameOffset is not 0, dwNameSize SHOULD also not be 0.
- **dwDataOffset (4 bytes):** A 32-bit field that contains the offset from the end of **dwPacketType** of the **data** field. If **dwDataOffset** is 0, the packet does not include application data.
- dwDataSize (4 bytes): A 32-bit field that contains the size, in bytes, of the data field. If dwDataOffset is set to 0, dwDataSize SHOULD also be 0. If dwDataOffset is not 0, dwDataSize SHOULD also not be 0.
- **data (variable):** A variable-length field that contains a byte array that provides the application data. This field's position is determined by **dwDataOffset** and the size stated in **dwDataSize**.
- name (variable): A variable-length field that contains a zero-terminated wide character array that specifies the player's name. This field's position is determined by dwNameOffset and the size stated in dwNameSize.

# 2.2.5.2 DN\_UPDATE\_INFO

Response from the host/server to a <u>DN\_REQ\_UPDATE\_INFO</u> packet. This packet is sent to all **players** with the updated information.

dwPacketType (4 bytes): A 32-bit field that contains the packet type.

Value	Meaning
DN_MSG_INTERNAL_UPDATE_INFO 0x0000000DB	Update info response from a host/server to a peer/client.

**dwPacketContext (4 bytes):** A 32-bit field that contains the context value passed in for this operation. This value MUST be passed back exactly as it was passed in with DN\_REQ\_UPDATE\_INFO (section 2.2.5.1).

**dpnid (4 bytes):** A 32-bit field that contains the identifier for the peer/client that was updated. For more information, see section 2.2.7.

dwVersion (4 bytes): A 32-bit integer that specifies the current name table version.

dwVersionNotUsed (4 bytes): Not used.

dwInfoFlags (4 bytes): A 32-bit field that contains the passed flags that were updated.

Value	Meaning
DPNINFO_NAME 0x00000001	Indicates whether a name is included with this packet.
DPNINFO_DATA 0x00000002	Indicates whether data is included with this packet.

- **dwNameOffset (4 bytes):** A 32-bit field that contains the offset from the end of **dwPacketType** of the **name** field for the **DPNID**. If **dwNameOffset** is 0, the packet does not include name data.
- dwNameSize (4 bytes): A 32-bit field that contains the size, in bytes, of the data in the name field. If dwNameOffset is set to 0, dwNameSize SHOULD also be 0. If dwNameOffset is not 0, dwNameSize SHOULD also not be 0.
- **dwDataOffset (4 bytes):** A 32-bit field that contains the offset from the end of **dwPacketType** of the **data** field. If **dwDataOffset** is 0, the packet does not include application data.
- dwDataSize (4 bytes): A 32-bit field that contains the size, in bytes, of the data field. If dwDataOffset is set to 0, dwDataSize SHOULD also be 0. If dwDataOffset is not 0, dwDataSize SHOULD also not be 0.
- **dpnidRequesting (4 bytes):** A 32-bit field that contains the identifier for the player that requested that this information be updated. For more information, see section 2.2.7.
- **data (variable):** A variable-length field that contains a byte array that provides the application data. This field's position is determined by **dwDataOffset** and the size stated in **dwDataSize**.
- name (variable): A variable-length field that contains a zero-terminated wide character array that specifies the player's name. This field's position is determined by dwNameOffset and the size stated in dwNameSize.

#### 2.2.6 DN\_NAMETABLE

The **name table** is a concept used by **DirectPlay** to keep all participants in a **game session** in sync with the different actions that are being performed.

The name table is really a table of **players** and **groups** that are included in the game session. Each change to the state of the table is a versioned name table operation. Any participant in the game session who applies these operations will generate a view that is consistent with every other players' name table.

The following table identifies the name table operations that can be performed.

Action	Meaning
0x000000C6	DN_INSTRUCT_CONNECT (section 2.2.1.9)
0x000000D0	DN_ADD_PLAYER (section <u>2.2.1.7</u> )
0x000000D1	DN_DESTROY_PLAYER (section 2.2.2.2)
0x000000D7	DN_CREATE_GROUP (section 2.2.4.2)
0x000000D8	DN_DESTROY_GROUP (section 2.2.4.8)
0x000000D9	DN_ADD_PLAYER_TO_GROUP (section 2.2.4.4)
0x000000DA	DN_DELETE_PLAYER_FROM_GROUP (section 2.2.4.6)

Action	Meaning
0x000000DB	DN _UPDATE_INFO (section 2.2.5.2)

The host/server is responsible for all name table operations, and all **peers** in the game session MUST maintain their own name table copy for use in **host migration**. All participants MUST also preserve a record of all operations that they have performed on the name table that have incremented the version number used during host migration.

The first operation in the name table is set to a version number of 1 and each subsequent operation increments the version by one. Every time the modulo 4 result of the new version number of the name table is equal to 0, each non-host peer SHOULD send a <a href="DN NAMETABLE VERSION">DN NAMETABLE VERSION</a> message to the host reporting the current name table version of the peer. The host SHOULD track the versions reported by all peers and determine the oldest version number from all reports. When the oldest version number advances, the host SHOULD send a <a href="DN RESYNC VERSION">DN RESYNC VERSION</a> message to all participants indicating the new oldest value. All participants SHOULD then release their records of all name table operations with versions older than this value, as they will no longer be needed during host migration.

# 2.2.7 DN\_DPNID

The **DPNID** is a unique identifier created by a **DirectPlay** host and server for each **player** and **group** included in a **game session**. A DPNID value is created for a player or group at the time when that player or group is added to the game session. The DPNID for each player and group in the game session MUST be unique. The value 0x0 is an invalid value for a DPNID.

The DPNID for a player or group is generated in several steps, at the time when the player or group is added to the game session.

1. The index of the entry in the name table that was used to create the player or group is stored in the lowest 20 bits of the DPNID. For example, when the index of the entry within the **name table** is 5, the index is stored as follows:

0xNNN00005

2. Along with the index, the version of the name table that existed when the entry was created is also stored. For example, when the name table version is 10 (0x0A), the index is stored as follows:

0x00A00005

3. This value is then XOR'd with the first 32 bits of the game session instance **GUID** to obfuscate. For example, if the instance GUID begins with 0xA1B2C3D4, the DPNID 0x00A00005 value would be XOR'd with 0xA1B2C3D4 to obfuscate as follows:

0xA112C3D1

It is important to point out that the DirectPlay host will use the DPNID of a player or group to determine the location for this entry in the name table.

## 2.2.8 DN\_ADDRESSING\_URL

**DirectPlay** represents addresses for an application in the form of a URL. The structure of the URL is as follows:

x-directplay:/key1=value1;key2=value2;key3=value3;...

All configuration information for a provider is specified using "key=value" pairs separated by semicolons.

**Note** This is the opaque representation of a URL, where a single slash mark "/" is used as a scheme terminator, not double slash mark "//". The responsibility of data interpretation is placed on the consumer of the URL and nothing else can be assumed.

A DirectPlay URL has three components: the scheme, the scheme separator, and the URL data:

**Scheme**: The scheme used for a DirectPlay URL is "x-directplay".

**Scheme separator**: The scheme separator is simply the string ":/" (a colon followed by a slash mark), implying that the data that follows is "opaque" and does not conform to the Internet standard. It MUST NOT be "://" (a colon followed by two slash marks) because the addition of the second slash mark implies an Internet standard for the remaining data, and the DirectPlay data does not conform to the Internet standard. If the second slash mark is detected, DirectPlay will flag the URL as invalid.

**URL data**: The URL data is a combination of "key=value" strings, where each string is separated by a semicolon. The semicolon character is reserved by the URL specification as being scheme-specific, and all of the URL data MUST be in canonicalized form to prevent misinterpretation.

There are no ordering requirements for the "key=value" pairs in the data, except for the "provider" key that is expected to be first to speed up parsing. All "key" identifiers SHOULD be lower-case and SHOULD not contain characters that are considered reserved, including the semicolon (;), the slash mark (/), the question mark (?), the colon (:), the at sign (@), the equals sign (=), the ampersand (&), and the number sign (#). All "value" strings will be treated as case-sensitive to cover future uses.

The following table identifies the current "keys" and their valid "values".

Кеу	Value
applicationinstance	Text representation of a <b>GUID</b> for an application instance.
baud	Any valid baud rate (subject to potential validation). Used by <b>modem</b> and <b>serial links</b> .
device	Text representation of a device GUID.
flowcontrol	"NONE", "XONXOFF", "RTS", "DTR", or "RTSDTR". Used by modem and serial links.
hostname	Any valid hostname, used only for IP and Internetwork Packet Exchange (IPX).
parity	"NONE", "EVEN", "ODD", "MARK", or "SPACE". Used by modem and serial links.
phonenumber	Any valid telephone number. Used by modem links.
port	Any valid port address, used for IP and IPX, up to the maximum port value of 65535.
program	Text representation of the program GUID.
provider	Text representation of the <b>service provider</b> GUID.
stopbits	"1", "1.5", or "2". Used by modem and serial links.

**Note** The URL specification reserves the question mark character (?) and the number sign (#) to represent "extra information" at the end of a URL. DirectPlay reserves the number sign token to indicate "user data" appended to the end of a URL. The concept of user data is provided as a means to supply application-specific information in a DNAddress while performing a lobbied launch of that application.

### **URL Examples**

## **IP Address**

x-directplay:/

#### **IPX Address**

x-directplay:/
provider=%7B53934290-628D-11D2-AE0F-006097B01411%7D;
device=%7BIPX ADAPTER GUID%7D;port=00230#IPXUserData

#### **Serial Address**

x-directplay:/
provider=%7B743B5D60-628D-11D2-AE0F-006097B01411%7D;
device=%7BCOM PORT GUID%7D;baud=57600;stopbits=1;parity=NONE;
flowcontrol=RTSDTR#SerialUserData

#### **Modem Address**

x-directplay:/
provider=%7B6D4A3650-628D-11D2-AE0F-006097B01411%7D;
device=%7BMODEM DEVICE GUID%7D;
phonenumber=555-1212#ModemUserData

# 2.2.9 DN\_ALTERNATE\_ADDRESS (IPv4)

In **DirectPlay** 9, the DN\_ALTERNATE\_ADDRESS structure provides additional options for Internet Protocol (IP) connectivity. The alternative addresses included in DN\_ALTERNATE\_ADDRESS are supplemental to the primary address specified in the DN\_ADDRESSING\_URL structure.

In the DN\_ALTERNATE\_ADDRESS structure, the **wPort** field is derived from its conversion into a 2-byte binary value, and the **dwAddrIn** field is derived from its conversion into a 4-byte binary value. Both of these fields are treated as single binary buffers, and therefore, are not handled in **network byte order**. For example, a port value of 2302 would be converted into its 2-byte binary value of 00001000 111111110, and an **IPv4** transport address of 65.52.239.061 would be converted into its 4-byte binary IN ADDR value of 01000001 00110100 11101111 00111101.

The <u>DN ALTERNATE ADDRESS (IPv6)</u> (section 2.2.10) structure demonstrates the contents of the same structure when it contains an **IPv6** alternative address.

**bSize (1 byte):** The size of this DN\_ALTERNATE\_ADDRESS (IPv4) structure excluding the size of this **bSize** field.

**bFamily (1 byte):** The address family for this DN\_ALTERNATE\_ADDRESS (IPv4) structure, which MUST be set to 0x02.

**wPort (2 bytes):** The port value for this DN\_ALTERNATE\_ADDRESS (IPv4) structure. This field is treated as a single buffer and is not specified in network byte order.

**dwAddrIn (4 bytes):** The address of the corresponding **IN\_ADDR (IPv4)** structure for this DN\_ALTERNATE\_ADDRESS (IPv4) structure, as described in [MS-DPDX] section 2.2.35.1. This field is treated as a single buffer and is not specified in network byte order.

# 2.2.10 DN\_ALTERNATE\_ADDRESS (IPv6)

The DN ALTERNATE ADDRESS structure is described in detail in section 2.2.9.

The following diagram represents the contents of the structure when it contains an **IPv6** alternative address. The DN\_ALTERNATE\_ADDRESS (IPv4) (section 2.2.9) structure demonstrates the contents of the same structure when it contains an **IPv4** alternative address.

- **bSize (1 byte):** The size of this DN\_ALTERNATE\_ADDRESS (IPv6) structure excluding the size of this **bSize** field.
- **bFamily (1 byte):** The address family for this DN\_ALTERNATE\_ADDRESS (IPv6) structure, which MUST be set to 0x17.
- **wPort (2 bytes):** The port value for this DN\_ALTERNATE\_ADDRESS (IPv6) structure. This field is treated as a single buffer and is not specified in **network byte order**.
- **dwAddrIn (16 bytes):** The address of the corresponding IN6\_ADDR (IPv6) structure for this DN\_ALTERNATE\_ADDRESS (IPv6) structure, as described in <a href="MS-DPDX">[MS-DPDX]</a> section 2.2.36.1. This field is treated as a single buffer and is not specified in network byte order.

# 3 Protocol Details

#### 3.1 Connect Role Details

Figure 1: Role of a client when joining the client to the session

The role of a client when attempting to connect to the session:

The client sends a <u>DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO</u> message (section 2.2.1.1) to the server and waits for the <u>DN\_SEND\_CONNECT\_INFO</u> message (section 2.2.1.4) to be sent in response. If the server does not respond in time, the protocol times out and terminates the connection.

**Note** When the client sends the DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO message, it includes the user-provided password described in section <u>5.2</u>. When the server receives the message, it attempts to verify the password as described in Step 4 of section <u>3.1.5.1</u>. If the server is able to verify the password, it sends a DN\_SEND\_CONNECT\_INFO message to bring the new client into consistency with regard to the current application description state and **player** list. The DN\_SEND\_CONNECT\_INFO message includes the current user password, which is essentially a redundant echo of the password that was verified by the server. However, if the server is unable to verify the password and validation fails, the server sends a <u>DN\_CONNECT\_FAILED</u> message (section 2.2.1.3) with the **hResultCode** field set to DPNERR\_INVALIDPASSWORD or to another validation failure code.

2. When the DN\_SEND\_CONNECT\_INFO message is received from the server, the client processes the message. After the message is successfully processed, the client MUST send a <a href="DN\_ACK\_CONNECT\_INFO">DN\_ACK\_CONNECT\_INFO</a> message (section 2.2.1.8) to the server. If an error occurs during message processing, the client performs cleanup and ends the connection attempt.

Figure 2: Role of the server when joining the client to the session

The role of the server when responding to a request from a client to be joined to the game session:

- 1. The server receives a DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO message from the client and begins message processing. If an error occurs during message processing, the message is ignored. Otherwise, the server responds to the client with a DN\_SEND\_CONNECT\_INFO message that includes the connection data for the **game session**.
- 2. The server waits for a DN\_ACK\_CONNECT\_INFO message from the client. If the client does not send the **acknowledgment (ACK)** in time, the protocol times out and terminates the connection.
- 3. When the DN\_ACK\_CONNECT\_INFO message from the client is received by the server, the server processes the ACK. After the ACK is successfully processed, the connection is made and the client is joined to the game session. If an error occurs during message processing, the server performs cleanup and ends the connection attempt.

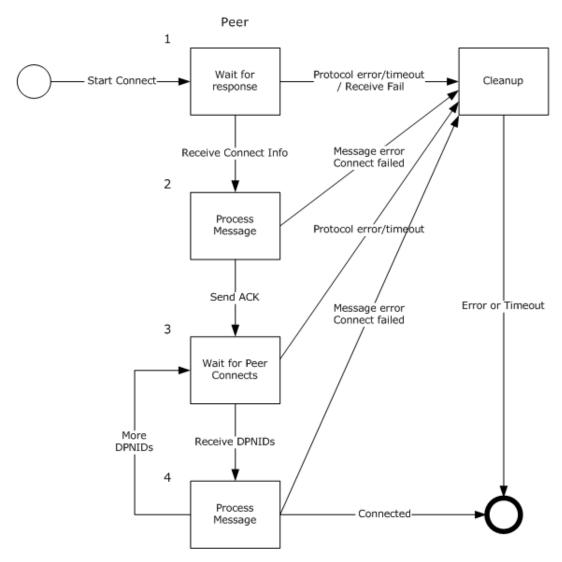

Figure 3: Role of a peer when adding the peer to the session

The role of a **peer** when attempting to be added to the game session:

- 1. The nascent peer sends a DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO message to the **host** and waits for a response. If the host does not respond in time, the protocol times out and terminates the connection.
- 2. When the DN\_SEND\_CONNECT\_INFO message is received from the host, the nascent peer processes the message. The peer MUST maintain a copy of the name table information for each peer in the game session as specified in the **DN\_NAMETABLE\_ENTRY\_INFO** field of the message. After the message is successfully processed, the nascent peer MUST send a DN\_ACK\_CONNECT\_INFO message to the host. If an error occurs during message processing, the nascent peer performs cleanup and ends the connection attempt.
- 3. After acknowledging the connection, the nascent peer waits to receive <u>DN SEND PLAYER DPNID</u> messages (section 2.2.1.10) from all other connected, established peers in the game session. If all connected, established peers do not respond in time, the protocol times out and terminates the connection.

- 4. When a DN\_SEND\_PLAYER\_DPNID message is received from an established peer, the nascent peer processes the message. If an established peer is unable to connect to the nascent peer:
  - The established peer responds to the host with a <u>DN\_INSTRUCTED\_CONNECT\_FAILED</u> message (section 2.2.1.11).
  - The connection attempt is canceled.
  - The host issues a <u>DN\_CONNECT\_ATTEMPT\_FAILED</u> message (section 2.2.1.12) to the nascent peer.

Otherwise, when DN\_SEND\_PLAYER\_DPNID messages have been successfully received from all other connected, established peers, the nascent peer is connected and added to the game session.

Figure 4: Role of the host when adding a peer to the session

The role of the host when responding to a request from a peer to be added to the game session:

The host receives a DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO message from a nascent peer and begins message processing. If an error occurs during message processing, the message is ignored. Otherwise, the host responds to the nascent peer with a DN\_SEND\_CONNECT\_INFO message that includes the connection data for the game session. At the same time, the host sends DN\_ADD\_PLAYER messages (section 2.2.1.7) to all connected, established peers in the game session.

- The peer processes the DN\_SEND\_CONNECT\_INFO message. The peer SHOULD maintain a copy
  of the name table information for each peer in the game session as specified in the
  DN\_NAMETABLE\_ENTRY\_INFO field of the message. The host waits for a
  DN\_ACK\_CONNECT\_INFO message from the nascent peer. If the nascent peer does not respond in
  time, the protocol times out and terminates the connection.
- 2. When the DN\_ACK\_CONNECT\_INFO message from the nascent peer is received by the host, the host processes the ACK. If an error occurs during processing of the ACK, the host performs cleanup and ends the connection attempt. Otherwise, after the ACK is processed, the host sends a <a href="DN\_INSTRUCT\_CONNECT">DN\_INSTRUCT\_CONNECT</a> message (section 2.2.1.9) to all peers (including the nascent peer)

instructing them to attempt a connection to the nascent peer. If an established peer is unable to connect to the nascent peer:

- The established peer responds to the host with a DN\_INSTRUCTED\_CONNECT\_FAILED message.
- The connection attempt is canceled.
- The host issues a DN CONNECT ATTEMPT FAILED message to the nascent peer.

Otherwise, it is assumed that the established peers are able to successfully connect to the nascent peer, and the nascent peer is added to the game session.

When the nascent peer receives a DN\_INSTRUCT\_CONNECT message from the host, the message is used only to synchronize its name table with the established peers.

#### 3.1.1 Abstract Data Model

The connect sequence is initiated by the client or the peer. If there happens to be an error or disconnect on the server/host, cleanup and disconnect happens with only the client/peer with the failure. (Remaining clients/peers in the session remain connected.)

A DirectPlay 8 Protocol: Core and Service Providers Protocol implementation MUST maintain the following data element:

**name table:** All participants MUST maintain a **name table**, as described in section 2.2.6. In **peer-to-peer mode**, the name table state MUST be kept consistent among all participants, and during connections:

- The host MUST generate a <u>DN\_ADD\_PLAYER</u> (section 2.2.1.7) name table operation associated with the connecting peer.
- Existing peers MUST process the DN\_ADD\_PLAYER name table operation from the host.
- New peers MUST construct the initial name table based on the entries contained in the <u>DN SEND CONNECT INFO (section 2.2.1.4)</u> message.

In client/server mode, each client only keeps name table entries that represent its player and the server player. Therefore, only this subset of the name table is synchronized with the server during connection.

# **3.1.2 Timers**

The connection sequence is event driven via packets sent and received via the Peer, Client, Host, or Server.

### 3.1.3 Initialization

None.

#### 3.1.4 Higher-Layer Triggered Events

None.

# 3.1.5 Processing Events and Sequencing Rules

### 3.1.5.1 Client/Server Connect Sequence

Figure 5: Client/server connect sequence

A server has been launched and is in the process of accepting incoming connections.

- 1. The client establishes a connection to the server as specified in [MC-DPL8R].
- 2. The client sends a player connect message to the server:
  - DN INTERNAL MESSAGE PLAYER CONNECT INFO
  - DN INTERNAL MESSAGE PLAYER CONNECT INFO EX (DirectPlay 9)

When the client sends the **player** connect message, it includes the user-provided password described in section  $\underline{5.2}$ , if present. When the server receives the message, it verifies the client has specified compatible values; if a higher layer indicated that a password is required, the client's password string MUST exist and match exactly. If no password is required, the server SHOULD silently ignore any password string specified by the client.

3. If the server successfully validates the password and other DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO information, the server responds to the client:

#### DN SEND CONNECT INFO

The DN\_SEND\_CONNECT\_INFO message MUST contain the current **game session** state and settings.

**Note** For client/server, there are only two entries in the <u>DN\_NAMETABLE\_ENTRY\_INFO</u> message as part of the DN\_SEND\_CONNECT\_INFO packet.

**Note** If a password was required, the message includes the **DPNSESSION\_REQUIREPASSWORD** flag and a redundant echo of the password that had been successfully verified. If no password was required, the **DPNSESSION\_REQUIREPASSWORD** SHOULD NOT be included, and the **dwPasswordOffset** and **dwPasswordSize** values SHOULD be 0.

If the server is unable to verify the password and validation fails, the server sends a <a href="DN CONNECT FAILED">DN CONNECT FAILED</a> message (section 2.2.1.3) with the **hResultCode** field set to DPNERR\_INVALIDPASSWORD or to another validation failure code.

4. Upon receipt of the DN\_SEND\_CONNECT\_INFO message from the server, the client acknowledges the connection by returning:

DN ACK CONNECT INFO

# **3.1.5.2 Peer-to-Peer Connect Sequence**

Figure 6: Peer-to-peer connect sequence

Assuming the first peer has been launched, that peer will be deemed the host of the game session and will be in the process of accepting incoming connections. (The peer host is responsible for all name table transactions and synchronization across peers in the game session.)

- 1. The new peer establishes a connection to the host as specified in [MC-DPL8R].
- 2. The internal player connect message is sent in from the peer to the host:
  - DN INTERNAL MESSAGE PLAYER CONNECT INFO
  - DN INTERNAL MESSAGE PLAYER CONNECT INFO EX (DirectPlay 9)

When the **peer** sends the **player** connect message, it includes the user-provided password described in section <u>5.2</u>, if present. When the host receives the message, it verifies the peer has specified compatible values; if a higher layer indicated that a password is required, the peer's password string MUST exist and match exactly. If no password is required, the host SHOULD silently ignore any password string specified by the peer.

3. If the host fails in validating DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO, the connecting peer is sent:

#### DN CONNECT FAILED

4. If the host successfully validates DN\_INTERNAL\_MESSAGE\_PLAYER\_CONNECT\_INFO, the host creates a new **name table entry** for the connecting peer and adds the new entry into the host's name table. The host increases its name table version by 1 and enters the new version into the new name table entry. The host then responds to the connecting peer with:

# DN SEND CONNECT INFO

The DN\_SEND\_CONNECT\_INFO message MUST contain the current **game session** state and settings. The message also contains a copy of the host's updated name table.

**Note** The entries in the <u>DN\_NAMETABLE\_ENTRY\_INFO</u> message will exist for each player connected to the game session.

**Note** If a password was required, the message includes the **DPNSESSION\_REQUIREPASSWORD** flag and a redundant echo of the password that had been successfully verified. If no password was required, the **DPNSESSION\_REQUIREPASSWORD** SHOULD NOT be included, and the **dwPasswordOffset** and **dwPasswordSize** values SHOULD be 0.

If the host is unable to verify the password and validation fails, the host sends a DN\_CONNECT\_FAILED message (section 2.2.1.3) with the **hResultCode** field set to DPNERR INVALIDPASSWORD or to another validation failure code.

5. At the same time as the host is responding to the connecting peer with DN\_SEND\_CONNECT\_INFO, the host is also issuing a message to the already-connected peers:

#### DN ADD PLAYER

The DN ADD PLAYER message contains the new name table entry for the connecting player.

6. Upon receipt of the DN\_SEND\_CONNECT\_INFO message from the host, the connecting peer will construct its initial name table state based on the entries and version number sent by the host and acknowledge the connection by returning:

# **DN ACK CONNECT INFO**

7. After receiving DN\_ACK\_CONNECT\_INFO from the connecting peer, the host instructs all existing peers to also establish a connection to the connecting peer by sending them the following message. The host will also send the following message to the connecting peer in order to keep the name table for the connecting peer in sync with the name tables of the existing peers in the session:

### **DN INSTRUCT CONNECT**

8. Upon receiving DN\_INSTRUCT\_CONNECT from the host, the existing peers will issue their **DPNIDs** to the new peer being added by sending:

#### DN SEND PLAYER DPNID

If the modulo 4 result of the new version for the name table is equal to 0, the name tables of the existing peers are updated as described in section 2.2.6 with:

# **DN RESYNC VERSION**

9. If existing peers are unable to successfully send the DN\_SEND\_PLAYER\_DPNID message to the connecting peer, the existing peers will issue a fail packet back to the host:

DN INSTRUCTED CONNECT FAILED

10. Upon receiving the DN\_INSTRUCTED\_CONNECT\_FAILED message from any of the existing peers, the host will send the connecting peer:

## **DN CONNECT ATTEMPT FAILED**

11. Host "removes player from the game session".

#### 3.1.6 Timer Events

None.

#### 3.1.7 Other Local Events

None.

#### 3.2 Disconnect Role Details

Figure 7: Role of a client and the server when disconnecting the client from the session

The role of the client when responding to the instruction to disconnect:

 The client receives a <u>DN\_TERMINATE\_SESSION</u> message (section 2.2.2.1) from the server and begins message processing. If an error occurs during message processing, or the received message is invalid, the client performs cleanup and the message is ignored. Otherwise, the client MUST remove itself from the game session.

The role of the server when responding to the instruction to disconnect:

 The server sends a DN\_TERMINATE\_SESSION message to the client and removes the client from the game session.

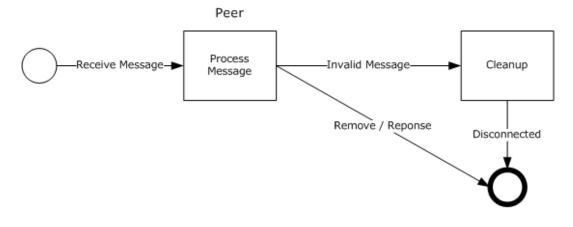

Figure 8: Role of a peer and the host when disconnecting the peer from the session

The role of a peer when responding to the instruction to disconnect:

The peer receives a DN\_TERMINATE\_SESSION message from the host and begins message processing. If an error occurs during message processing, or the received message is invalid, the peer performs cleanup and the message is ignored. Otherwise, the peer MUST disconnect from the game session.

The role of the host when instructing a peer to disconnect:

• The host sends a DN\_TERMINATE\_SESSION message to the disconnecting peer and sends a <a href="DN\_DESTROY\_PLAYER">DN\_DESTROY\_PLAYER</a> message (section 2.2.2.2) to the other connected peers in the game session. Upon receipt of the DN\_DESTROY\_PLAYER message from the host, the other connected peers MUST remove the indicated **player** (the disconnecting peer) from the game session.

Figure 9: Role of the host when performing a peer integrity check

The role of the host when responding to a request to check the integrity of a peer in the game session:

- The host receives an <u>DN REQ INTEGRITY CHECK</u> message (section 2.2.2.6) from a connected peer in the game session and begins message processing. (The peer that is making the request is asking the host to check the integrity of another peer in the game session.) If an error occurs during message processing, or the message is invalid, the host performs cleanup and the message is ignored. Otherwise, the host sends a <u>DN INTEGRITY CHECK</u> message (section 2.2.2.7) to the peer that is to be checked.
- 2. The host waits for a <u>DN\_INTEGRITY\_CHECK\_RESPONSE</u> message (section 2.2.2.8) from the peer that is being checked. If the peer does not respond in time, the protocol times out and disconnects the peer that was being checked from the game session. The host then sends a <u>DN\_DESTROY\_PLAYER</u> message to the other connected peers in the game session. Upon receipt of the <u>DN\_DESTROY\_PLAYER</u> message from the host, the other connected peers MUST remove the indicated player (the disconnecting peer) from the game session.
- 3. When a DN\_INTEGRITY\_CHECK\_RESPONSE message is received from the peer that is being checked, the host begins message processing. If an error occurs during message processing, or the message is invalid, the host performs cleanup and the message is ignored. Otherwise, the host sends a DN\_TERMINATE\_SESSION message to the peer that sent the DN\_REQ\_INTEGRITY\_CHECK message, and sends a DN\_DESTROY\_PLAYER message to the other connected peers in the game session. Upon receipt of the DN\_DESTROY\_PLAYER message from the host, the other connected peers MUST remove the indicated player (the terminated peer) from the game session.

Figure 10: Role of a peer during host migration

The role of a peer when responding to a request to perform **host migration**:

- The peer receives a <u>DN HOST MIGRATE</u> message (section 2.2.2.3) from the host and begins message processing. If an error occurs during message processing, or the message is invalid, the peer performs cleanup and the message is ignored. Otherwise, the peer responds to the host by sending the **name table** version of the peer via a <u>DN NAMETABLE VERSION</u> message (section 2.2.2.4).
- 2. The peer waits for an **acknowledgment (ACK)** from the host. If the host does not respond in time, the protocol times out and terminates the connection.
- 3. When the response is received from the host, the peer processes the message.

- 1. If the host has responded with a <u>DN HOST MIGRATE COMPLETE</u> message (section 2.2.2.11), the peer processes the message. If an error occurs during message processing, or the message is invalid, the peer performs cleanup and the instruction to migrate is ignored. Otherwise, host migration is complete.
- 2. If the host has responded with a <u>DN\_REQ\_NAMETABLE\_OP</u> message (section 2.2.2.9) to the peer, the peer processes the request and sends a <u>DN\_ACK\_NAMETABLE\_OP</u> message (section 2.2.2.10) to the host.
- 4. The peer waits for a response from the host. If the host does not respond in time, the protocol times out and terminates the connection.
- 5. When the response message is received from the host, the peer processes the messages. The peer MAY receive a <a href="DN\_RESYNC\_VERSION">DN\_RESYNC\_VERSION</a> message (section 2.2.2.5) and SHOULD receive a <a href="DN\_HOST\_MIGRATE\_COMPLETE">DN\_HOST\_MIGRATE\_COMPLETE</a> message from the host. If an error occurs during message processing, or these messages are invalid, the peer performs cleanup and the messages are ignored. Otherwise, host migration is complete.

Figure 11: Role of the host during host migration

The role of the host when initiating host migration:

- 1. The host sends a DN\_HOST\_MIGRATE message to all connected peers in the game session and waits to receive a DN\_NAMETABLE\_VERSION message from each peer. If a peer does not respond in time, the protocol times out and terminates the connection for that peer.
- 2. When the DN\_NAMETABLE\_VERSION response is received from a peer, the host processes the message. If the host receives an invalid name table response message, the host performs cleanup and the message is ignored.
- 3. Otherwise, the host examines the peer's name table to determine if it is newer than the host's name table.
  - 1. If the peer's name table is older than the host's name table, the host sends a DN\_HOST\_MIGRATE\_COMPLETE message to that peer.
  - 2. If the peer's name table is newer than the host's name table, the host sends a DN\_REQ\_NAMETABLE\_OP message to that peer and waits for a response. If the peer does not respond in time, the connection to that peer is dropped from the game session.
- 4. When the DN\_ACK\_NAMETABLE\_OP message is received from the peer, the host processes the message and uses the peer's name table to update it's own name table. The host then MAY send a DN\_RESYNC\_VERSION message containing the new name table version to all connected peers in the game session. Finally, the host sends a DN\_HOST\_MIGRATE\_COMPLETE message to all connected peers in the game session.

#### 3.2.1 Abstract Data Model

If there is an error with the protocol or message on the server/host, cleanup and disconnect happen with only the client/peer with the failure. (Remaining clients/peers in the session remain connected.)

A DirectPlay 8 Protocol: Core and Service Providers Protocol implementation MUST maintain the following data element:

**name table:** All participants MUST maintain a consistent **name table**, as described in section <u>2.2.6</u>. In **peer-to-peer mode**:

- If the host disconnects from the **game session**, the process of **host migration** is initiated in which the remaining peers examine the current state of the name table to identify the player with the next lowest version number to become the new host.
- If a peer disconnects from the game session, the host MUST generate a
   <u>DN DESTROY PLAYER (section 2.2.2.2)</u> name table operation to remove the disconnecting player
   from the name tables of all remaining participants.

# In client/server mode:

- Each client only keeps name table entries that represent its player and the server player, and is not informed of other clients leaving.
- When a client leaves, the server updates only its own name table.
- If the server disconnects, the game session is terminated.

#### **3.2.2 Timers**

The disconnect sequence is event driven via messages sent and received via the Peer, Client, Host, or Server.

#### 3.2.3 Initialization

None.

### 3.2.4 Higher-Layer Triggered Events

None.

## 3.2.5 Processing Events and Sequencing Rules

#### 3.2.5.1 Client/Server Disconnect Sequence

Figure 12: Client/server disconnect sequence

The server is purposefully removing a **peer** from the **game session**.

1. The server issues a packet to the client being removed:

**DN TERMINATE SESSION** 

- 2. When the client receives the DN\_TERMINATE\_SESSION message, it is required to disconnect itself from the game session.
- 3. If a client wants to leave the game session, it SHOULD issue a disconnect in the protocol to the server. (No core specific messages.)

## 3.2.5.2 Peer-to-Peer Host Disconnect Sequence

Figure 13: Peer-to-peer host disconnect sequence

1. If the host is purposefully removing a peer from the game session, it will issue a packet to the peer being removed:

**DN TERMINATE SESSION** 

The peer receiving the DN\_TERMINATE\_SESSION MUST disconnect all connections and leave the game session.

2. The host also issues a message to the remaining connected peers indicating the removal of the disconnecting peer:

#### **DN DESTROY PLAYER**

# 3.2.5.3 Peer-to-Peer Integrity Check Sequence

Figure 14: Peer-to-peer integrity check sequence

 If a nonhost peer has detected a loss of connection to another peer and has not received a <u>DN DESTROY PLAYER</u> message from the host for that peer, it sends a message notifying the host:

### DN REQ INTEGRITY CHECK

2. The host forwards a packet to the peer in question including the **DPNID** of the questioning peer:

## **DN INTEGRITY CHECK**

3. Upon receiving DN\_INTEGRITY\_CHECK, the peer responds back to the host:

### **DN INTEGRITY CHECK RESPONSE**

4. If the host receives DN\_INTEGRITY\_CHECK\_RESPONSE, the host will respond to the first peer terminating it from the **game session**:

#### **DN TERMINATE SESSION**

5. The host also issues a message to the remaining connected peers indicating the removal of the disconnecting peer:

DN\_DESTROY\_PLAYER

# 3.2.5.4 Peer-to-Peer Host Disconnect (Possible Host Migration)

Figure 15: Peer-to-peer host disconnect (possible host migration)

The **host** drops out of the **game session**.

1. Using the version information for each **player** from the **name table**, the player with the lowest version number (connected **peer**) becomes the expected host. (This can be split out to more than one host, if multiple connections are severed when a host leaves.) That new host sends to the remaining connected peers:

# **DN HOST MIGRATE**

2. All peers still in the game session will respond to the new host, providing the host with their name table versions:

#### DN NAMETABLE VERSION

3. If the host sees that there is a peer with a newer name table, the new host will request that peer to send the entries from its name table that are not contained within the host's name table:

# DN REQ NAMETABLE OP

4. Upon receiving DN\_REQ\_NAMETABLE\_OP, the peer will return the missing name table entries to the host:

#### DN ACK NAMETABLE OP

5. The host installs any missed name table entries and sends any name table operations missed by its peers as indicated by their reported name table versions in step 2. When all missing name table entries have been provided to all players, the host can confirm that all peers have the current name table version by sending:

DN RESYNC VERSION

6. After the name table has been brought up-to-date, the new host will respond to all connected peers:

**DN HOST MIGRATE COMPLETE** 

### 3.2.6 Timer Events

None.

#### 3.2.7 Other Local Events

None.

# 3.3 Send/Receive Communications Role Details

Peer/Host/Client/Server

Figure 16: Role of the peer, host, client, and server when sending and receiving messages

The role of the **peer**, **host**, client, and server when sending messages (section 2.2.3):

- 1. When any message is sent, if the sender specifies <u>DN\_REQ\_PROCESS\_COMPLETION</u> (section 2.2.3.2) to indicate that the receiving application MUST confirm delivery of the sent message, the sender waits to either receive a <u>DN\_PROCESS\_COMPLETION</u> response message (section 2.2.3.3), or to be notified of connection termination by the lower-layer transport that is handling reliable message delivery <u>[MC-DPL8R]</u>. If the connection is terminated prior to receiving a response, the sender MUST treat the send operation as having failed in addition to performing standard disconnect handling as described in section <u>3.2</u>.
- Otherwise, when the DN\_PROCESS\_COMPLETION message is received, the send/receive is completed.

The role of the peer, host, client, and server when receiving messages (section 2.2.3):

When any message is received, the message is processed by the receiver. If the message is found to be invalid, the receiver performs cleanup and the message is ignored. Otherwise, when the message is valid and it contains a DN\_REQ\_PROCESS\_COMPLETION request, a DN\_PROCESS\_COMPLETION response message is sent back to the sender. If the message does not contain a request for process completion, the message is consumed.

#### 3.3.1 Abstract Data Model

Illustrated in this model is a send where the process completion request has been sent. In the non-process completion case, the messages are just consumed with no retained state.

#### **3.3.2 Timers**

The send/receive sequence is event driven via messages sent and received via the Peer, Client, Host, or Server. The DirectPlay 8 Protocol: Core and Service Providers does not directly implement timing-related functionality; instead, it relies on internal timer events described in [MC-DPL8R] 3.1.2.5to provide feedback regarding the state of individual connections. When a connection has been lost, the DirectPlay 8 Protocol [MC-DPL8R] reports this to its consumers. The DirectPlay 8 Protocol: Core and Service Providers MUST then handle the disconnect as described in section 3.2.

# 3.3.3 Initialization

None.

#### 3.3.4 Higher-Layer Triggered Events

# 3.3.5 Processing Events and Sequencing Rules

# 3.3.5.1 Client/Server and Peer-to-Peer Send/Receive Communications Sequence

Figure 17: Communications Exchange diagram

Data send and receive sequences are identical for client/server and peer-to-peer modes.

There are two types of general data sends. One requires notification from the **game session** that the user data has been consumed, and the other does not.

To differentiate, on the **data frame (DFRAME)** that is handed up from the protocol, if the **bCommand** field has the PACKET\_COMMAND\_USER\_1 bit set, then this is a system message where PacketType and PacketContext will be included.

1. If an application sends data to another application and wants a response when that data has been consumed, then it will send:

#### DN REQ PROCESS COMPLETION

2. When DN\_REQ\_PROCESS\_COMPLETION is received, it is required that a message be returned indicating that this **payload** has been consumed:

### **DN PROCESS COMPLETION**

If the **bCommand** bit does not have the PACKET\_COMMAND\_USER\_1 bit set, the data passed up via the payload is data that SHOULD be passed directly to the application with no further interpretation.

**Note** If Packet\_Command\_User\_1 is set in the DFRAME, this indicates that it is a core message with the first four bytes indicating the PacketType and is always sent reliably.

#### 3.3.6 Timer Events

None.

#### 3.3.7 Other Local Events

# 3.4 Groups Role Details

Figure 18: Role of a peer and the host when sending and receiving Group messages

The role of a **peer** and the **host** when sending Group messages (section 2.2.4):

- 1. When any of the following messages are sent, the peer waits for a response from the host.
  - <u>DN REQ CREATE GROUP</u> (section 2.2.4.1)
  - DN REQ ADD PLAYER TO GROUP (section 2.2.4.3)
  - <u>DN REQ DESTROY GROUP</u> (section 2.2.4.7)

If the host does not respond in time, the protocol times out and the connection is terminated.

- 2. Otherwise, when the peer receives any of the following messages in response from the host, the peer processes the message.
  - <u>DN CREATE GROUP</u> (section 2.2.4.2)
  - DN ADD PLAYER TO GROUP (section 2.2.4.4)
  - DN DESTROY GROUP (section 2.2.4.8)

If the message is invalid, the peer performs cleanup and the message is ignored. Otherwise, the message is consumed.

The role of a peer and the host when receiving Group messages:

- When any of the following messages is received from a peer in the session, it is processed by the host.
  - DN\_REQ\_CREATE\_GROUP
  - DN\_REQ\_ADD\_PLAYER\_TO\_GROUP
  - DN\_REQ\_DESTROY\_GROUP

If the message is invalid, the host performs cleanup and the message is ignored. Otherwise, the host responds with one of the following messages back to the peer:

- DN CREATE GROUP
- DN ADD PLAYER TO GROUP
- DN DESTROY GROUP

**Note** When working with **groups**, be aware of considerations related to **DirectX Diagnostic** (**DXDiag**). The DXDiag tool (DxDiag.exe) implementation of this specification does not support groups.

#### 3.4.1 Abstract Data Model

A DirectPlay 8 Protocol: Core and Service Providers Protocol implementation MUST maintain the following data element:

name table: All participants MUST maintain a name table, as described in section 2.2.6. Each group has an entry in the name table. In peer-to-peer mode, the host MUST generate DN CREATE GROUP (section 2.2.4.2), DN ADD PLAYER TO GROUP (section 2.2.4.4), DN DELETE PLAYER FROM GROUP (section 2.2.4.6), and DN DESTROY GROUP (section 2.2.4.8) name table operations for each corresponding action that modifies the groups or their membership in the name table.

In client/server mode, only the server has information pertaining to all players and groups. Therefore, the server does generate name table operations associated with group management.

#### **3.4.2 Timers**

The **group** sequences are driven via messages sent and received via the Peer, Client, Host, or Server.

#### 3.4.3 Initialization

# 3.4.4 Higher-Layer Triggered Events

None.

#### 3.4.5 Processing Events and Sequencing Rules

# 3.4.5.1 Client/Server Group Role

There are no transactions on the wire for **game session groups** in **client/server mode**. Game session groups are used only in peer-to-peer mode.

# 3.4.5.2 Peer-to-Peer Group Sequence

Figure 19: Peer-to-peer group sequence diagram

Only the **game session host** can create or modify **groups**. The host can create and destroy groups and add and remove players from existing groups.

1. If a non-host peer wants to create a group, it MUST issue a message to the host:

DN REQ CREATE GROUP

2. Once the host has created a new group (via request from a peer or locally), it issues a command to all the connected peers:

#### DN CREATE GROUP

3. If a non-host peer wants to add a new player to an existing group, it MUST issue a message to the host:

### DN REQ ADD PLAYER TO GROUP

4. Once the host has added the new player to the group (via a peer or locally), the host responds to all connected peers with:

#### DN ADD PLAYER TO GROUP

5. If a non-host peer wants to delete a player from an existing group, it MUST issue a message to the host:

# DN REQ DELETE PLAYER FROM GROUP

6. Once the host has deleted the player from the group (via a peer or locally), the host responds to all connected peers with:

#### DN DELETE PLAYER FROM GROUP

7. If a non-host peer wants to destroy an existing group, it MUST issue a message to the host:

### DN REQ DESTROY GROUP

8. Once the host has destroyed a group (via Req or locally), the host responds to all connected peers with:

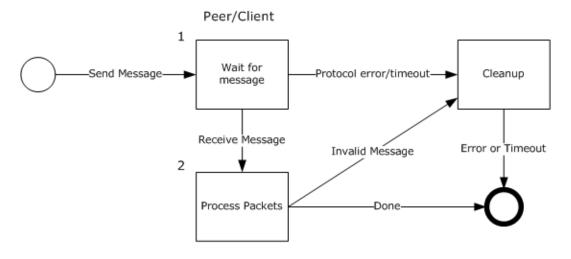

DN DESTROY GROUP

#### 3.4.6 Timer Events

None.

# 3.4.7 Other Local Events

# 3.5 Update Information Role Details

Figure 20: Role of a peer/client and the host/server when sending and receiving Update Information messages

The role of a peer/client when sending Update Information messages (section 2.2.5):

- 1. When a <u>DN\_REQ\_UPDATE\_INFO</u> message (section 2.2.5.1) is sent, the peer/client waits for a response from the host/server. If the host/server does not respond in time, the protocol times out and the connection is terminated.
- 2. Otherwise, when the peer/client receives the response from the host/server, the peer/client processes the message. If the message is invalid, the peer/client performs cleanup and the message is ignored. Otherwise, the <a href="https://doi.org/10.2016/journal.org/">DN UPDATE INFO</a> message (section 2.2.5.2) is consumed.

The role of the host/server when receiving Update Information messages:

When a DN\_REQ\_UPDATE\_INFO message is received from a peer/client in the session, the message is processed by the host/server. If the message is invalid, the host/server performs cleanup and the message is ignored. Otherwise, the host/server responds by sending a DN\_UPDATE\_INFO message back to the peer/client.

#### 3.5.1 Abstract Data Model

An update is requested by a **peer** or client to a **host** or server. The host/server will respond to all **players** with the appropriate response.

A DirectPlay 8 Protocol: Core and Service Providers Protocol implementation MUST maintain the following data element:

**name table:** All participants MUST maintain a **name table**, as described in section <u>2.2.6</u>. In **peer-to-peer mode**, the name table state MUST be kept consistent among all participants, and the host MUST generate a <u>DN UPDATE INFO (section 2.2.5.2)</u> name table operation associated with the modified player information.

In **client/server mode**, each client only keeps name table entries that represent its player and the server player, and is not informed of information changes pertaining to other players.

#### **3.5.2 Timers**

The update information sequence is event driven via messages sent and received via the Peer, Client, Host, or Server.

### 3.5.3 Initialization

None.

# 3.5.4 Higher-Layer Triggered Events

None.

#### 3.5.5 Processing Events and Sequencing Rules

#### 3.5.5.1 Update Information Sequence

Figure 21: Update Information Sequence Diagram

This is used whenever a peer/client needs to update player or group information.

1. The packet is sent to the host/server because the host/server is responsible for updating the **name table** and keeping everyone in sync:

# **DN REQ UPDATE INFO**

2. The **host** SHOULD respond appropriately to all players with the updated information:

**DN UPDATE INFO** 

# 3.5.6 Timer Events

None.

### 3.5.7 Other Local Events

# 4 Protocol Examples

A standard <u>DN INTERNAL MESSAGE PLAYER CONNECT INFO EX</u> (section 2.2.1.2) for a DirectPlay 8 Protocol: Core and Service Providers **game session**. This example includes the full Ethernet frame for the packet sent.

#### In little-endian byte order:

- **MSGID** =  $0 \times 00000000C1$
- dwFlags indicates that this is a DN\_OBJECT\_TYPE\_PEER.
- Player Name value of "Test User".

Upon success, the **host** will respond with the DN\_SEND\_CONNECT\_INFO (section <u>2.2.1.4</u>) packet to the connecting **peer**. This example includes the full Ethernet frame for the packet sent.

#### In network byte order:

- **MSGID** =  $0 \times 0000000002$
- dwFlags indicates that DPNSESSION\_MIGRATE\_HOST is allowed.
- dwMaxPlayers is not specified.
- dwCurrentPlayers is set to 2 for the host and connecting peer.
- dpnid for the connecting player value is 0x948E8120.
- Name table version entry of 0x03.
- dwEntryCount is set to 2.
- dwMembershipCount is 0, indicating no groups in the game session.
- Connecting Peers Name is "Test User".
- Host Peers Name is "Test User".
- Game session Name is "Test Session".
- Player Name value of "Test User".

Given a game session with two connected peers, the following is an example of general data passed between the peers. The following is the message "Hi there", where the message includes the full 400-byte buffer. Everything after the plain text in this example is just random memory. This example includes the full Ethernet frame for the packet sent.

# 5 Security

# **5.1 Security Considerations for Implementers**

The DirectPlay 8 Protocol: Core and Service Providers provides no security features beyond those included in the underlying DirectPlay 8 Protocol: Reliable ([MC-DPL8R]). The following are some security features that implementers might consider including in their implementations:

- Check all packets to ensure that they are of the proper length and contain valid values.
- Ignore malformed messages and messages from unknown clients, unless otherwise specified by the protocol.

# **5.2 Index of Security Parameters**

It is up to the application that is using the DirectPlay 8 Protocol: Core and Service Providers to implement security. The following table allows only for simple passwords to be passed across **game sessions**, but because these are transferred in the free and clear to the protocol, they cannot be used for robust security.

**DirectPlay** allows the application to specify simple passwords defined as a simple method to avoid unauthorized connections to the game session. Passwords are provided by the users in the game session as part of the application user interface. If the password provided by a user is not the same between the client and the host, then the host rejects the connection attempt by the user and returns an error.

Security parameter	Section
Password (variable)	DN INTERNAL MESSAGE PLAYER CONNECT INFO, DN INTERNAL MESSAGE PLAYER CONNECT INFO EX (sections 2.2.1.1 and 2.2.1.2)
Password (variable)	DN_SEND_CONNECT_INFO (section 2.2.1.4)

# 6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- Windows XP operating system
- Windows Server 2003 operating system
- Windows Vista operating system
- Windows Server 2008 operating system
- Windows 7 operating system
- Windows Server 2008 R2 operating system
- Windows 8 operating system
- Windows Server 2012 operating system
- Windows 8.1 operating system
- Windows Server 2012 R2 operating system
- Windows 10 operating system
- Windows Server 2016 operating system
- Windows Server 2019 operating system
- Windows Server 2022 operating system
- Windows 11 operating system
- Windows Server 2025 operating system

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

# 7 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact <a href="mailto:dochelp@microsoft.com">dochelp@microsoft.com</a>.

Section	Description	Revision class
6 Appendix A: Product Behavior	Added Windows Server 2025 to the list of applicable products.	Major
