# Layer 2 Tunneling Protocol (L2TP) IPsec Extensions

#### **Intellectual Property Rights Notice for Open Specifications Documentation**

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- Copyrights. This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- No Trade Secrets. Microsoft does not claim any trade secret rights in this documentation.
- Patents. Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft Open Specifications Promise or the Microsoft Community Promise. If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplq@microsoft.com.
- **License Programs**. To see all of the protocols in scope under a specific license program and the associated patents, visit the Patent Map.
- **Trademarks**. The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit <a href="https://www.microsoft.com/trademarks">www.microsoft.com/trademarks</a>.
- **Fictitious Names**. The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights**. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

**Tools**. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

**Support.** For questions and support, please contact <u>dochelp@microsoft.com</u>.

# **Revision Summary**

Date	Revision History	Revision Class	Comments
10/24/2008	0.1	New	Version 0.1 release
12/5/2008	0.1.1	Editorial	Editorial Update.
1/16/2009	1.0	Major	Updated and revised the technical content.
2/27/2009	1.1	Minor	Clarified the meaning of the technical content.
4/10/2009	1.2	Minor	Clarified the meaning of the technical content.

# 1 (Updated Section) Introduction

The Layer 2 Tunneling Protocol (L2TP) is an Internet Engineering Task Force (IETF) standard protocol that allows IP, IPX, or NetBEUI traffic to be encrypted, and then sent over any medium that supports point-to-point (PPP) datagram delivery, such as IP, X.25, Frame Relay, or ATM (Point to Point Protocol [RFC1661]). See [RFC2661] section 1 for an introduction to L2TP. [RFC3193] specifies an Internet Engineering Task Force (IETF) standard protocol designed to use Internet Protocol Security (IPsec) [RFC2401] to provide for tunnel authentication, privacy protection, and integrity checking and replay protection of L2TP. See Point to Point Protocol [RFC1661]).

This document Layer 2 Tunneling Protocol (L2TP) IPsec Extensions (L2TPIE) specifies a set of vendorspecific options as well as non-standard options for Layer 2 Tunneling Protocol Internet Protocol security (IPsec.

in this document LAC (, L2TP Access Concentrator (LAC) and client are used interchangeably; similarly LNS (, L2TP Network Server (LNS) and server are used interchangeably.

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

# 1.1 (Updated Section) Glossary

This document uses the following terms:

- audio video profile (AVP): A Real-Time Transport Protocol (RTP) profile that is used specifically with audio and video, as described in [RFC3551]. It provides interpretations of generic fields that are suitable for audio and video media sessions.
- **AV pair**: An attribute/value pair. The name of some attribute, along with its value. AV pairs in NTLM have a structure specifying the encoding of the information stored in them.
- **globally unique identifier (GUID)**: A term used interchangeably with universally unique identifier (UUID) in Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the value. Specifically, the use of this term does not imply or require that the algorithms described in [RFC4122] or [C706] must be used for generating the GUID. See also universally unique identifier (UUID).
- Internet Protocol security (IPsec): A framework of open standards for ensuring private, secure communications over Internet Protocol (IP) networks through the use of cryptographic security services. IPsec supports network-level peer authentication, data origin authentication, data integrity, data confidentiality (encryption), and replay protection.
- **L2TP Access Concentrator (LAC)**: A node that acts as one side of an L2TP tunnel endpoint and is a peer to the L2TP Network Server (LNS). The LAC sits between an LNS and a remote system and forwards packets to and from each. Packets sent from the LAC to the LNS require tunneling with the L2TP protocol as defined in this document. The connection from the LAC to the remote system is either local or a PPP link.
- **L2TP Network Server (LNS)**: A node that acts as one side of an L2TP tunnel endpoint and is a peer to the L2TP Access Concentrator (LAC). The LNS is the logical termination point of a PPP session that is being tunneled from the remote system by the LAC.

**session**: An authenticated communication channel between the client and server correlating a group of messages into a conversation.

**tunnel**: The encapsulation of one network protocol within another.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

#### 1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

#### 1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

## 1.3 (Updated Section) Overview

Layer 2 Tunneling Protocol (L2TP) Internet Protocol security (IPsec) Extensions (L2TPIE) provides extensions to the Layer 2 Tunneling Protocol (L2TP) specification [RFC2661] and to securing L2TP withusing IPsec [RFC3193] in order to provide traceability and data control flow features. In this extension a new Microsoft vendor-specific attribute value pair (AV pair) is sent in control messages from the LAC/client to the LNS/server so that tracing events on the server specific to a client can be correlated. This extension uses the data control flow mechanism specified in [L2TP-draft].

L2TPIE defines additional AV pairs other than those defined in L2TP. It also defines changes to the behavior in processing messages or AV Pairs other than those that are defined in the L2TP

specification [RFC2661]. These extensions also define subset of [RFC3193]. For example, support for changing the IP address and port is restricted.

See [RFC2661] section 1 for an introduction to L2TP. [RFC3193] specifies an Internet Engineering Task Force (IETF) standard protocol designed to use IPsec [RFC2401] to provide for tunnel authentication, privacy protection, and integrity checking and replay protection of L2TP.

## 1.4 (Updated Section) Relationship to Other Protocols

This protocol Layer 2 Tunneling Protocol (L2TP) IPsec Extensions (L2TPIE) is based on L2TP [RFC2661], [L2TP-draft], and securing L2TP with IPsec [RFC3193] protocols. L2TPIE supports only IPsec transport mode. The following network stack diagram demonstrates the L2TP relationship of L2TP with other protocols in an IPsec transport mode.

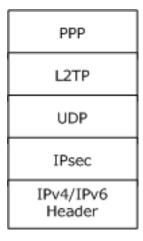

Figure 1: L2TP network stack

## 1.5 Prerequisites/Preconditions

None beyond those specified in [RFC2661], [L2TP-draft], and [RFC3193].

#### 1.6 (Updated Section) Applicability Statement

This protocol Layer 2 Tunneling Protocol (L2TP) IPsec Extensions (L2TPIE) is applicable when the implementation uses L2TP [RFC2661] and secures L2TP with IPsec [RFC3193].

#### 1.7 (Updated Section) Versioning and Capability Negotiation

<u>L2TPIE</u>Layer 2 Tunneling Protocol (L2TP) IPsec Extensions (L2TPIE) is based on version 2 of the L2TP protocol, as specified in section 3.1 of [RFC2661].

#### 1.8 (Updated Section) Vendor-Extensible Fields

The vendor-extensible fields described in this document comply with section 4.1 of [RFC2661], which specifies how vendor-specific AV pairpairs are passed. The vendor ID for Microsoft vendor-specific AVPsAV pairs is 0x137. The vendor-extensible options used by L2TP are specified in section 2.2.1.

# 1.9 (Updated Section) Standards Assignments

The only standards assignment required for this protocol is *Private Enterprise Number*. The required value for this parameter is 311 (see [IANA-ENT] for details).

<b>Parameter</b>	Value	Reference
Private Enterprise Number	311	[IANA-ENT]

# 2 Messages

## 2.1 (Updated Section) Transport

All <u>Layer 2 Tunneling Protocol (</u>L2TP) attributes are transported within L2TP, which is transported over UDP [RFC768] as specified in section 8.1 of [RFC2661] and IPsec, as specified in [RFC3193]. L2TP Network Server (LNS) listens for L2TP messages on the UDP port.<1>

## 2.2 (Updated Section) Message Syntax

These <u>Layer 2 Tunneling Protocol (L2TP)</u> IPsec extensions use the message format for vendor-specific options, as specified in [RFC2661] section 4.1. All option fields and values described in this document are sent in network-byte order unless indicated otherwise.

# 2.2.1 (Updated Section) L2TP AV pairs

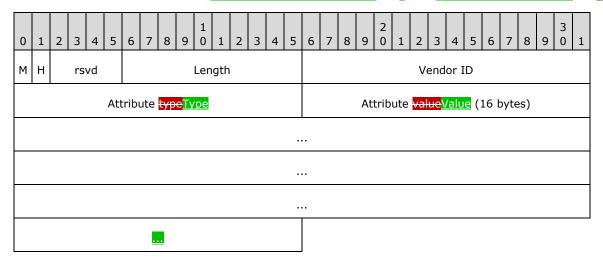

<u>Layer 2 Tunneling Protocol (</u>L2TP) AV pairs have **Vendor ID** fields. The value 0, corresponding to the IETF adopted attribute values, is used for all AV pairpairs defined in [RFC2661]. This specification defines the Microsoft vendor-specific AV pair ATTR\_VEN\_MS\_CorrID\_Type. The **Vendor ID** for Microsoft vendor-specific AVPsAV pairs is 0x137...<2>

Field Name	Value	Meaning
Attribute Type	0x01 (ATTR_VEN_MS_CorrID_Type)	Microsoft vendor-specific correlation ID type (2.2.1.1)

# 2.2.1.1 (Updated Section) L2TP AV Pair: Microsoft Vendor-specific Correlation ID Type (0x01)

This The Microsoft vendor-specific correlation ID type option is sent in Incoming-Call-Request (ICRQ) control messages so that any tracing application is able to correlate the messages pertaining to a particular tunnel context on the L2TP Access Concentrator (LAC) and L2TP Network Server (LNS.).

M (1 bit): The Mandatory (M) bit. MUST be set to 0.

**H (1 bit):** The Hidden (H) bit. MUST be set to 0.

rsvd (4 bits): Reserved bits. MUST be set to 0.

Length (10 bits): MUST be set to 22.

**Vendor ID (2 bytes):** MUST be set to 0x137.

Attribute type (2 bytes): MUST be set to 0x01.

**Attribute** value (16 bytes): MUST be a 16-byte GUID, as specified in [MS-DTYP] section 2.3.4.2. This SHOULD be unique for every ICRQ request on and LAC/LNS combination.

# 2.2.2 (Updated Section) L2TP Congestion Control (Reset)

<u>L2TPIE implements</u> <u>Layer 2 Tunneling Protocol (L2TP) IPsec Extensions (L2TPIE) implement</u> the flow control for data packets, as defined in section 4.3 of [L2TP-draft]. (Flow control was removed from [RFC2661].)

#### 3 Protocol Details

#### 3.1 Common (LAC/LNS) Details

#### 3.1.1 (Updated Section) Abstract Data Model

The <u>Layer 2 Tunneling Protocol (L2TP) IPsec Extensions (L2TPIE)</u> state machine MUST conform to the state machine specified in section 7 of [RFC2661].

#### 3.1.2 (Updated Section) Timers

These extensions Layer 2 Tunneling Protocol (L2TP) IPsec Extensions do not define any timers beyond those described in [RFC2661] and [RFC3193].

#### 3.1.3 (Updated Section) Initialization

These extensions Layer 2 Tunneling Protocol (L2TP) IPsec Extensions do not define any initialization beyond that specified in [RFC2661] and [RFC3193]. The configuration values of various configurable parameters are read from the registry.<3>

# 3.1.3.1 (Updated Section) Securing L2TP with IPsec

The L2TP per-packet security check is specified in section 3.3 of [RFC3193]. The LAC/LNS MAY verify the UDP port value in the packet that is received with the socket information that is used to set up the L2TP tunnel.

Section 4 of [RFC3193] specifies IPsec filtering details when protecting L2TP.

Section 4.2.3 of [RFC3193] specifies how a Responder chooses a new address, if it is capable of doing so. The responder MUST NOT choose a new IP address during L2TP negotiation. The client SHOULD disconnect the session when it receives a StopCCN message. It SHOULD NOT check the Result code or the error code.

Section 2 of [RFC3193] specifies the L2TP security requirements.

Section 4.2.2 of [RFC3193] specifies filters for protecting L2TP.

Section 5.1.4 of [RFC3193] specifies usage of pre-shared keys.

#### 3.1.4 Higher-Layer Triggered Events

The higher layer can initiate a request to disconnect an established call session. When the higher layer requests to disconnect an established call session, the LAC/LNS MUST initiate the session teardown, as specified in section 5.6 of [RFC2661]. After the session teardown is complete, if no more call sessions exist between LAC and LNS, the control connection between LAC and LNS SHOULD be disconnected by initiating the control connection teardown, as specified in section 5.7 of [RFC2661].

#### 3.1.5 Message Processing Events and Sequencing Rules

None beyond those specified in [RFC2661] and [RFC3193].

# 3.1.5.1 (Updated Section) Header Format

All reserved bits MUST be set to 0 on outgoing messages and ignored on incoming messages (section 3.1 of [RFC2661]). If the L2TP header of a received packet has any bits set other than T, L, and S (the reserved bits as specified in [RFC2661]), the LAC/LNS discards the packet. For outgoing calls, the LNS will stop the session setup attempt and will not resend the Outgoing-Call-Request (OCRQ-).<4>

Section 5.8 of [RFC2661] specifies the sequence number in the Header. <5>

# 3.1.5.2 (Updated Section) Control Message AV Pairs

Section 4 of [RFC2661] specifies control message AV pairs.

If a received message has an AVPAV pair with

- any of the reserved bits set to 1 or,
- the M bit set and a non-IETF vendor-idID value or,
- an unrecognized Attribute value or,
- the **M** and **H** bits set, and the AVPAV pair has an attribute other than the following:
  - Proxy Authen Name
  - Proxy Authen Challenge
  - Proxy Authen Id
  - Proxy Authen Response
  - Called Number
  - Calling Number
  - Sub-Address
  - Initial Received LCP CONFREQ
  - Last Sent LCP CONFREQ
  - Last Received LCP CONFREQ
  - ACCM
  - Private Group ID

#### then

- If the Control Message AVP control message AV pair is in a control connection management message, the control connection MUST be torn down.
- If the Control Message AVP control message AV pair is in the call session management messages, the corresponding call session MUST be torn down.

The following AV pairs are ignored if they are hidden (**H** bit set to 1), even if the **M** bit is set.

- Proxy Authen Name
- Proxy Authen Challenge
- Proxy Authen ID

- Proxy Authen Response
- Called Number
- Calling Number
- Sub Address
- Initial Received LCP CONFREQ
- Last Sent LCP CONFREQ
- Last Received LCP CONFREQ:
- ACCM
- Private Group ID

None of the AV pairs sent by LAC/LNS have the **H** bit set to 1.

Section 4.4 of RFC [RFC2661] provides a list of all L2TP AV pairs, some of which are Hiddenhidden.

## 3.1.5.3 Start-Control-Connection-Request (SCCRQ)

Section 6.1 of [RFC2661] specifies the AV pairs for the Start-Control-Connection-Request (SCCRQ) message.<6>

#### 3.1.5.4 Start-Control-Connection-Reply (SCCRP)

Start-Control-Connection-Reply (SCCRP) is the control message sent in response to SCCRQ. Section 6.2 of [RFC2661] specifies the AV pairs used with SCCRP.<7>

#### 3.1.5.5 Start-Control-Connection-Connected (SCCCN)

Start-Control-Connection-Connected (SCCCN) is the control message sent in response to SCCRP. Section 6.3 of [RFC2661] specifies the AV pairs used with SCCCN.<8>

# 3.1.5.6 Stop-Control-Connection-Notification (StopCCN)

Stop-Control-Connection-Notification (StopCCN) is the control message sent to inform the peer that the tunnel is being shut down and the control connection closed. Section 6.4 of [RFC2661] specifies the AV pairs used by StopCCN.<9>

# 3.1.5.7 Hello (HELLO)

Hello (HELLO) is the control message used as a "keepalive" for the tunnel; see section 6.5 of [RFC2661] for details.<10>

# 3.1.5.8 (Updated Section) Call-Disconnect-Notify (CDN)

Call-Disconnect-Notify (CDN) is the control message sent by and LAC or LNS to request disconnection of a specified call within a tunnel, as specified in section 6.2 of [RFC2661].<11>

## 3.1.5.9 Set-Link-Info (SLI)

The Set-Link-Info (SLI) message is an L2TP control message sent by the LNS to the LAC to set PPP-negotiated options, as specified in section 6.14 of [RFC2661]. The LAC MUST ignore this message and it SHOULD NOT be sent by the LNS.

#### 3.1.6 Timer Events

None beyond those specified in [RFC2661] and [RFC3193].

#### 3.1.7 Other Local Events

None.

## 3.2 LAC/Client Details

#### 3.2.1 (Updated Section) Abstract Data Model

The <u>Layer 2 Tunneling Protocol (L2TP) IPsec Extensions (L2TPIE)</u> state machine MUST conform to the state machine specified in [RFC2661] section 7.<12>

#### **3.2.2 Timers**

No timers are defined beyond those described in [RFC2661] and [RFC3193].

#### 3.2.3 Initialization

None beyond those specified in [RFC2661] and [RFC3193].

# 3.2.4 (Updated Section) Higher-Layer Triggered Events

Apart from the disconnect event specified in section 3.1.4, a LAC can receive a request to establish an L2TP call session from the higher layer. To establish an L2TP call session, the LAC MUST establish a control connection with LNS, as specified in section 5.1 of [RFC2661], if not already established. Once the control connection is available, LAC MUST send the Incoming-Call-Request (ICRO) message (section 6.6 of [RFC2661]), as specified in section 5.2.1 of [RFC2661], to establish the L2TP call session with LNS.

## 3.2.5 Message Processing Events and Sequencing Rules

None beyond those specified in [RFC2661] and [RFC3193].

# 3.2.5.1 (Updated Section) Incoming-Call-Request (ICRQ)

Incoming Call Request (ICRQ) specifies the control message sent by the LAC to anal LNS when an incoming call is detected (see section 6.6 of [RFC2661]).<13>

The Microsoft vendor-specific correlation ID type (section 2.2.1.1) AV pair SHOULD be sent in the ICRQ message and SHOULD also be logged on the client machine for debugging.

# 3.2.5.2 (Updated Section) Incoming-Call-Connected (ICCN)

Incoming-Call-Connected (ICCN) is the control message sent by the LAC to LNS in response to a received <a href="Incoming-Call-Reply">Incoming-Call-Reply</a> (ICRP) message (see section 6.8 of [RFC2661]). The LAC MAY send a Receive Window Size <a href="AVPAV pair">AVPAV pair</a> in the ICCN message.<a href="ICCN">14></a>

## 3.2.5.3 (Updated Section) Outgoing-Call-Reply (OCRP)

Outgoing-Call-Reply (OCRP) is the control message sent by the LAC to  $\frac{200}{200}$  LNS in response to an OCRQ (see section 6.10 of [RFC2661]). <15>

#### 3.2.5.4 Outgoing-Call-Connected (OCCN)

Outgoing-Call-Connected (OCCN) is the control message sent by LAC to LNS following the OCRP, and after the outgoing call has been completed (see section 6.11 of [RFC2661]). The LAC MAY send a Receive Window Size AV pair and Sequencing Required AV pair in the OCCN message.<16>

#### 3.2.5.5 WAN-Error-Notify (WEN)

WAN-Error-Notify (WEN) specifies the control message sent by LAC to LNS to indicate a WAN error condition (see section 6.13 of [RFC2661]).<17>

#### 3.2.6 Timer Events

None beyond those specified in [RFC2661] and [RFC3193].

## 3.2.7 (Updated Section) Other Local Events

Tracing or debugging logs on the LAC/Clientclient SHOULD include the ATTR\_VEN\_MS\_CorrID\_Type specified in section 2.2.1.1. Debugging connection setup issues on the LAC/Clientclient is made easy by looking for the corresponding log on the LNS/server. Because ATTR\_VEN\_MS\_CorrID\_Type is unique for every connection a tracing/debugging application will be able to correlate the events specific to a connection on the LNS/server.

#### 3.3 LNS/Server Details

#### 3.3.1 (Updated Section) Abstract Data Model

The <u>Layer 2 Tunneling Protocol (L2TP) IPsec Extensions (L2TPIE)</u> state machine MUST conform to the state machine specified in section 7 of [RFC2661].

#### **3.3.2 Timers**

None beyond than those required for implementation as specified in section 5.8 of [RFC2661].

# 3.3.3 Initialization

None beyond those specified in [RFC2661] and [RFC3193].

#### 3.3.4 Higher-Layer Triggered Events

None beyond the specification in section 3.1.4.

## 3.3.5 Message Processing Events and Sequencing Rules

None beyond those specified in [RFC2661] and [RFC3193].

## 3.3.5.1 (Updated Section) Incoming-Call-Reply (ICRP)

Incoming-Call-Reply (ICRP) specifies the control message sent by the LNS to ana LAC in response to ICRQ (see section 6.7 of ∰RFC2661]).<18>

## 3.3.5.2 (Updated Section) Incoming-Call-Connected (ICCN)

Incoming-Call-Connected (ICCN) is the control message sent by the LAC to LNS in response to a received ICRP message (see section 6.8 of [RFC2661]). The LAC MAY send the Receive Window Size AV pair. The LNS MAY close the call if the received Framing Type AV pair has a value other than <a href="Synchronous Framing">Synchronous Framing</a> (1)synchronous framing in the ICCN message.<19>

# 3.3.5.3 Outgoing-Call-Request (OCRQ)

Outgoing-Call-Request (OCRQ) is the control message sent by the LNS to the LAC to indicate that an outbound call from the LAC is to be established (see section 6.6 of [L2TP-draft]).<20> The LNS SHOULD NOT send the Called Number AV pair in the OCRQ message.

# 3.3.5.4 Outgoing-Call-Reply (OCRP)

Outgoing-Call-Reply (OCRP) specifies the control message sent by the LAC to the LNS in response to OCRQ (see section 6.10 of [RFC2661]). <21>

## 3.3.5.5 (Updated Section) Outgoing-Call-Connected (OCCN)

Outgoing-Call-Connected (OCCN) specifies the control message sent by and LAC to and LNS following the OCRP and after the outgoing call has been completed (see section 6.11 of [RFC2661]).<22>

#### 3.3.5.6 (Updated Section) WAN-Error-Notify (WEN)

WAN-Error-Notify (WEN) specifies the control message sent by and LAC to and LNS to indicate a WAN error condition (see section 6.13 of [RFC2661]).<23>

#### 3.3.6 Timer Events

None beyond those specified in [RFC2661] and [RFC3193].

# 3.3.7 (Updated Section) Other Local Events

Tracing or debugging logs on the LNS/Serverserver SHOULD include the ATTR\_VEN\_MS\_CorrID\_Type specified in 2.2.1.1. Debugging connection setup issues on the LAC/Clientclient is made easy by looking for the corresponding log on the LNS/Serverserver. Because ATTR\_VEN\_MS\_CorrID\_Type is unique for every connection a tracing/debugging application will be able to correlate the events specific to a connection on the LNS/Serverserver.

# 4 (Updated Section) Protocol Examples

The following example shows the sequence of messages exchanged when a machine running Windows Vista operating system with Service Pack 1 (SP1) (name: "testclient.contoso.com") with IP address 1.1.1.1(client 100mbps connection) establishes an L2TP tunnel with a machine running Windows Server 2008 operating system (name: "testserver.contoso.com") with IP address 2.2.2.2 (server, 100mbps connection).

Before starting L2TP protocol the following filters are applied:

Server plumbs following IPsec filters during its initialization.

#### Inbound Filters

```
Source Address: Any, Destination Address: 2.2.2.2, Protocol: UDP, Source port:1701, Destination Port: Any

Source Address: Any, Destination Address: 2.2.2.2, Protocol: UDP, Source port:1701, Destination Port: 1701

Source Address: Any, Destination Address: 2.2.2.2, Protocol: UDP, Source port: Any, Destination Port: 1701
```

# Outbound Filters

```
Source Address: 2.2.2.2, Destination Address: Any, Protocol: UDP, Source port: Any, Destination Port: 1701

Source Address: 2.2.2.2, Destination Address: Any, Protocol: UDP, Source port: 1701, Destination Port: 1701

Source Address: 2.2.2.2, Destination Address: Any, Protocol: UDP, Source port: 1701, Destination Port: Any
```

Client plumbs following IPsec filters before it connects to VPN server.

#### Inbound Filters

```
Source Address: 2.2.2.2, Destination Address: 1.1.1.1, Protocol: UDP, Source port: Any, Destination Port: 1701

Source Address: 2.2.2.2, Destination Address: 1.1.1.1, Protocol: UDP, Source port: 1701, Destination Port: 1701
```

## Outbound Filters

```
Source Address: 1.1.1.1, Destination Address: 2.2.2.2, Protocol: UDP, Source port: 1701, Destination Port: Any

Source Address: 1.1.1.1, Destination Address: 2.2.2.2, Protocol: UDP, Source port: 1701, Destination Port: 1701
```

# Process:

```
Start-Control-Connection-Request (SCCRQ) is a control message used to
initialize a tunnel between and LNS and and LAC. LAC initiates the tunnel establishment process in this example. A UDP packet with source IP address
1.1.1.1 and source port 1701 is sent by LAC to destination IP address
2.2.2.2 and destination port 1701 to begin the tunnel establishment process.
Following are the details of the L2TP packets:
    Header:
        T bit is set to 1 to indicate control message
        L bit is set to 1 to indicate length is present
        S bit is set to indicate Nr and Ns are present
        Version field is set to 0x02
        Length field is set to 0x84
        All other fields in the header are set to 0
    The following AVPsAV pairs are sent:
    Message Type:
        Flags: M is set to 0x1, length is set to 0x8, rest are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x0 (Message type)
        Message Type in Attribute Value is set to 0x0001 (SCCRQ)
        Length is set to 0x8
    Protocol Version:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x2 (Protocol Version)
        Ver field is set to 0x01
        Rev field is set to 0x0
    Framing Capabilities:
        Flags: M is set to 0x1, length is set to 0x10, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x3 (Framing Capabilities)
        S bit is set to 0x1 (Synchronous framing), all other bits are 0x0
    Bearer Capabilities:
        Flags: length is set to 0x10, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x4 (Bearer Capabilities)
        all other fields are 0x0
    Firmware revision:
        Flags: length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x6 (Firmware revision)
        Firmware version is set to (0x600)
        Flags: M is set to 0x1, length is set to 0x16 rest are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x7 (Host name)
        Hostname is set to ASCII string "testclient.contoso.com"
    Vendor name:
        Flags: length is set to 0x0F, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x8 (Vendor name)
        Vendor name is set to ASCII string "Microsoft"
    Assigned Tunnel
```

Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0

```
VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x9 (Assigned Tunnel)
        Assigned tunnelID is set to OxdOxD (just a sample)
    Receive Window
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to OxaOxA (Receive Window)
        Window size is set to 0x8
On Receiving the above previous packet, the server responds with SCCRP with the following
details:
    Header:
        T bit is set to 1 to indicate control message
        L bit is set to 1 to indicate length is present
        S bit is set to indicate Nr and Ns are present
        Version field is set to 0x02
        Length field is set to 0x68
        TunnelId is set to 0xD (this value is extracted from Assigned Tunnel \frac{\text{AVPAV pair}}{\text{AVPAV pair}} in SCCRP)
        Sequence Number expected is set to 0x1
        All other fields in the header are set to 0
    The following AVPs AV pairs are sent:
    Message Type:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x0 (Message type)
        Message Type in Attribute Value is set to 0x0002 (SCCRP)
        Length is set to 0x8
    Protocol Version:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x2 (Protocol Version)
        Ver field is set to 0x01
        Rev field is set to 0x0
    Framing Capabilities:
        Flags: M is set to 0x1, length is set to 0x10, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x3 (Framing Capabilities)
        S bit is set to 0x1(Synchronous framing), all other bits are 0x0
    Bearer Capabilities:
        Flags: length is set to 0x10, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x4 (Bearer Capabilities)
        All other fields are 0x0
    Host name:
        Flags: M is set to 0x1, length is set to 0x16, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x7 (Host name)
         Hostname is set to ASCII string "testserver.contoso.com"
    Vendor name:
        Flags: length is set to 0x0F, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x8 (Vendor name)
        Hostname is set to ASCII string "Microsoft"
    Assigned Tunnel
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x9 (Assigned Tunnel)
        Assigned tunnelID is set to \frac{0 \times d}{0 \times 1}
    Receive Window
```

```
Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to Oxa
(Receive Window)
        Window size is set to 0x8
On receiving the SCCRP the client responds with SCCCN with the following details:
        T bit is set to 1 to indicate control message \,
        L bit is set to 1 to indicate length is present
        {\tt S} bit is set to indicate {\tt Nr} and {\tt Ns} are present
        Version field is set to 0x02
        Length field is set to 0x14
        TunnelId is set to 0xD
        Sequence Number expected is set to 0x1
        Sequence Number is set to 0x1
        All other fields in the header are set to 0
    The following AVPs AV pairs are sent:
    Message Type:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x0 (Message type)
        Message Type in Attribute Value is set to 0x0003 (SCCCN)
        Length is set to 0x8
The client then sends ICRQ with the following details:
    Header:
        T bit is set to 1 to indicate control message
        L bit is set to 1 to indicate length is present
        S bit is set to indicate Nr and Ns are present
        Version field is set to 0x02
        Length field is set to 0x46
        TunnelId is set to 0xD
        Sequence Number expected is set to 0x1
        Sequence Number is set to 0x2
        All other fields in the header are set to 0
    The following AVPs AV pairs are sent:
    Message Type:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x0 (Message type)
        Message Type in Attribute Value is set to <a href="https://dx.000A">0x000A</a> (ICRQ)
        Length is set to 0x8
    Assigned Session Id:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0xE (Assigned Session Id)
        Assigned Session Id field is set to 0x01
    Call Serial Number:
        Flags: M is set to 0x1, length is set to \frac{0xa}{0xA}, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0xF (Call Serial Number)
        Call Serial Number is set to 0x0
    Bearer Type:
        Flags: length is set to \frac{0 \times a}{0 \times A}, all other flags are 0 \times 0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x12 (Bearer Type)
        Bearer Type: A bit is set to 0x1 (Analog channel), all other bits are 0x0
    Correlation Id:
        Flags: length is set to 0x2D, all other flags are 0x0
        VendorId is set to 0x137 (Microsoft)
```

```
Attribute Type is set to 0x1 (Correlation Id)
        Attribute value in this example is the following 16 bit value:
          15 78 28 BF 3C 66 CO 4A 9D D9 6D 93 35 D4 32 B3 (randomly
          generated value)
The client logs the correlation ID so that tracing and debugging applications
can use this correlation ID to look at the logs on the server and correlate the
events on the client and server.
The server then responds with ICRP with the following
details:
    Header:
        T bit is set to 1 to indicate control message
        L bit is set to 1 to indicate length is present
        S bit is set to indicate Nr and Ns are present
        Version field is set to 0x02
        Length field is set to 0x28
        TunnelId is set to 0xD
        Session ID is set to 0x1
        Sequence Number expected is set to 0x3
        Sequence Number is set to 0x1
        All other fields in the header are set to 0
   The following AVPs AV pairs are sent:
    Message Type:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x0 (Message type)
        Message Type in Attribute Value is set to \frac{0 \times 0000b}{0 \times 0000B} (ICRP)
        Length is set to 0x8
    Assigned Session Id:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0xE (Assigned Session Id)
        Assigned Session Id field is set to 0x01
The server logs the correlation ID received in ICRP request in its trace logs
so that if the connection is torn down, an administrator will be able to find
out why a particular client connection could not go through.
The client then sends ICCN with the following details:
    Header:
        T bit is set to 1 to indicate control message
        L bit is set to 1 to indicate length is present
        S bit is set to indicate Nr and Ns are present
        Version field is set to 0x02
        Length field is set to 0x48
        TunnelId is set to 0xD
        Sequence Number expected is set to 0x2
        Sequence Number is set to 0x3
        All other fields in the header are set to 0
```

The following  $\frac{AVPs}{AV}$  pairs are sent:

Message Type:

Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0

VendorId is set to 0x0 (IETF)

Attribute Type is set to 0x0 (Message type)

Message Type in Attribute Value is set to  $\frac{0 \times 0000 \text{c}}{0 \times 0000 \text{c}}$  (ICCN)

Length is set to 0x8

Tx Connection Speed:

Flags: M is set to 0x1, length is set to  $\frac{0xa}{0xA}$ , all other flags are 0x0

VendorId is set to 0x0 (IETF)

Attribute Type is set to 0xE (Tx Connection Speed)

Tx Connection Speed field is set to Ox5f5E100
0x5F5E100 (100 mbps)

```
Framing type:
        Flags: M is set to 0x1, length is set to \frac{0 \times a}{10 \times a}, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x3 (Framing Type)
        S bit in Framing type is set to 0x1 rest are set to 0x0
        Proxy Authen Type:
        Flags: length is set to \frac{0 \times a}{0 \times A}, all other flags are 0 \times 0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x1D (Proxy Authen Type)
        Proxy Authen Type is set to 0x4 (No Authentication)
The client sends CDN in order to disconnect with the
following details:
    Header:
        T bit is set to 1 to indicate control message
        L bit is set to 1 to indicate length is present
        S bit is set to indicate Nr and Ns are present
        Version field is set to 0x02
        Length field is set to 0x38
        TunnelId is set to 0xD
        Sequence Number expected is set to 0x2
        Sequence Number is set to 0x4
        All other fields in the header are set to 0
    The following AVPs AV pairs are sent:
    Message Type:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x0 (Message type)
        Message Type in Attribute Value is set to 0x000E (CDN)
        Length is set to 0x8
    Assigned Session Id:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0xE (Assigned Session Id)
        Assigned Session Id field is set to 0x01
    Result Code
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x1 (Result Code)
        Result Code is set to 0x0003
        Error Code is set to 0 \times 0000 Length is set to 0 \times 0000
The client then sends StopCCN the following details:
    Header:
        {\tt T} bit is set to 1 to indicate control message
        L bit is set to 1 to indicate length is present
        S bit is set to indicate Nr and Ns are present
        Version field is set to 0x02
        Length field is set to 0x26
        TunnelId is set to 0xD
        Sequence Number expected is set to 0x2
        Sequence Number is set to 0x5
        All other fields in the header are set to 0
    The following AVPs AV pairs are sent:
    Message Type:
        Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
        VendorId is set to 0x0 (IETF)
        Attribute Type is set to 0x0 (Message type)
        Message Type in Attribute Value is set to 0x0004 (StopCCN)
        Length is set to 0x8
```

Assigned Tunnel

Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
VendorId is set to 0x0 (IETF)
Attribute Type is set to 0x9 (Assigned Tunnel)
Assigned tunnelID is set to 0x4
Length is set to 0x8

Result Code

Flags: M is set to 0x1, length is set to 0x8, all other flags are 0x0
VendorId is set to 0x0 (IETF)
Attribute Type is set to 0x1 (Result Code)
Result Code is set to 0x0001
Error Code is set to 0x0000
Length is set to 0x0000

# **5** Security

# **5.1** Security Considerations for Implementers

All of the security considerations that are applicable to L2TP [RFC2661] and securing L2TP with IPsec [RFC3193] also apply to the Layer 2 Tunneling Protocol (L2TP) IPsec Extensions.

# **5.2 Index of Security Parameters**

None.

# 6 (Updated Section) Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- Windows 2000 operating system
- Windows XP operating system
- Windows Server 2003 operating system
- Windows Vista operating system
- Windows Server 2008 operating system
- Windows 7 operating system
- Windows Server 2008 R2 operating system
- Windows 8 operating system
- Windows Server 2012 operating system
- Windows 8.1 operating system
- Windows Server 2012 R2 operating system
- Windows 10 operating system
- Windows Server 2016 operating system
- Windows Server operating system
- Windows Server 2019 operating system

#### Windows Server 2022 operating system

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

- <1> Section 2.1: Source port used is <a href="https://oxenses.com/dx6a50x6A5">0x6a50x6A5</a>.
- <2> Section 2.2.1: The use of Microsoft vendor-specific AVPSAV pairs and the ATTR\_VEN\_MS\_CorrID\_Type are supported beginning with Windows Vista operating system with Service Pack 1 (SP1) and Windows Server 2008.
- <3> Section 3.1.3: The registry subkey used by Windows to store configuration data for WAN Miniportdevices Miniport devices using the Layer 2 Tunneling Protocol (L2TP) driver is HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\Class\{4D36E972-E325-11CE-BFC1-08002BE10318}\<Device-number>, where <Device-number> is the number of one of the 4-digit numbered subkeys in the {4D36E972-E325-11CE-BFC1-08002BE10318} subkey. The particular subkey differs between computers. To determine which of the numbered subkeys stores L2TP driver data on your computer, look for the value "Wan Miniport (L2TP)" (without quotes), in the DriverDesc entry in each numbered subkey.

<4> Section 3.1.5.1: Applicable Windows releases send the congestion control bit R as specified in section 4.3 of [L2TP-draft]. The R bit sending mechanism can be controlled using the registry key HKLM\SYSTEM\CurrentControlSet\Control\Class\{4D36E972-E325-11CE-BFC1-08002BE10318}\<Device-number>\PayloadReceiveWindow.

If the key is absent, or is present with value 0, sequencing is disabled and hence the R bit is not sent.

<5> Section 3.1.5.1: The LAC/LNS accepts messages with sequence number Ns from Nr up to Nr+Nx-1, where Nx is a number indicating how many out-of-order messages the receiver can buffer. The default value for Nx is 100, which can be changed by adding the registry key HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\Class\{4D36E972-E325-11CE-BFC1-08002BE10318}\MaxOutOfOrder. The acceptable values for this registry key are between 0 and 0x4000, both inclusive. The newly received out-of-order message is queued for reordering. If the newly received message is a duplicate of a message already in the out-of-order queue, it is silently discarded.

When a packet is received with the value of Ns being greater than or equal to Nr+Nx, the packet is silently dropped (the state machine behaves as though it never received this packet).

<6> Section 3.1.5.3: The SCCRQ message sent by Windows LAC/LNS would have the following optional AV pairs:

- Bearer Capabilities
- Receive Window Size
- Challenge
- Firmware Revision
- Vendor Name: The vendor name is "Microsoft" (without quotes) in ASCII encoding.

The SCCRQ message received at LAC/LNS does not check for the presence of the Host Name AV pair.

If the SCCRQ message received has a Bearer Capabilities AV pair, then the tunnel's Bearer Capability is set to the received value; else it is set to 0.

If the received SCCRQ message has a Receive Window AV pair, then the tunnel's Send Window is set to the received value, else the Send Window is set to 4.

The Tie Breaker AV pair is not processed by the LAC/LNS.

<7> Section 3.1.5.4: The following AV pairs are present in the SCCRP message sent by LAC/LNS as specified in section 6.2 of [RFC2661].

- Bearer Capabilities
- Firmware Revision
- Vendor Name: The vendor name is "Microsoft" (without quotes) in ASCII encoding.
- Receive Window Size: This is sent with the **M** bit set to 1. The value of the Receive Windows Size is configurable with the default being 4.
- Challenge
- Challenge Response

The SCCRP message received at LAC/LNS does not check for the presence of the Host Name AV pairs.

If the SCCRP message received has Bearer Capabilities AV pairs, then the tunnel's Bearer Capability is set to the received value: else it is set to 0.

If the received SCCRP message has Receive Window AV pairs, then the tunnel's Send Window is set to the received value; else the Send Window is set to 4.

<8> Section 3.1.5.5: The following AV pairs are pair is present in the SCCCN message sent by ana LAC/LNS:

 Challenge Response: This AV pair is sent if a Challenge AV pair was received in the corresponding SCCRP message.

<9> Section 3.1.5.6: The LAC/LNS does not send an Error Message string in the Result Code AV pair of the StopCCN message.

<10> Section 3.1.5.7: This message is implemented by the LAC/LNS. The Hello Timer value (in milliseconds) can be set by using the registry key HKLM\SYSTEM\CurrentControlSet\Control\Class\{4D36E972-E325-11CE-BFC1-08002BE10318}\<Device-number>\HelloMs. If the registry key is present with value 0, then the Hello timer is disabled. If the registry key is absent, then the default value used is 40 seconds.

<11> Section 3.1.5.8: The Result Code AV pair sent by the LAC/LNS does not contain an Error Message string.

<12> Section 3.2.1: The LAC/LNS neither sends the Tie Breaker AVPAV pair nor processes it. If the TunnelId present in the Start-Control-Connection-Request (SCCRQ) message received from the peer is the same as the TunnelId sent to the peer, the SCCRQ message is ignored and the state machine does not transition from the wait-ctl-reply state. If the TunnelId present in the SCCRQ message received from the peer is different from the TunnelId sent to the peer, the SCCRQ message received is treated as a new control connection request. The state machine for the new control connection will transition from idle to wait-ctl-conn state. This will result in two control channels which are agnostic of each other. Call sessions can be negotiated over either of these control tunnels. Since each tunnel provides a data channel between the LAC/LNS, the data packets can flow over either of them. The choice of the data channel for sending or receiving data packets is not deterministic.

<13> Section 3.2.5.1: The LAC sends the following AV pairs in the ICRQ message:

- Bearer Type
- Physical Channel ID

The LNS server ignores the Bearer Type AVPAV pair, and the server's behavior is unaffected by the presence or absence of a Bearer Type AVPAV pair.

If the LNS does not receive a Physical Channel ID AVPAV pair, it assumes a value of 0xFFFFFFFF.

<14> Section 3.2.5.2: The LAC sends the following AV pairs in the ICCN message:

- Proxy Authen Type (Proxy Authen Type = No Authentication = 4)
- Sequencing Required

If the registry key HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\Class\{4D36E972-E325-11CE-BFC1-08002BE10318}\<Device-number>\PayloadReceiveWindow is present and has a non-zero value, then a Receive Window Size ([RFC2661] section 4.4.3) AV pair is sent by the Windows LAC. If this registry key is absent, which is the default case, or if the key has a value of zero, then the Receive Window Size AVPAV pair is not sent.

<15> Section 3.2.5.3: LAC sends the Physical Channel ID AV pair in the OCRP message. If the LNS does not receive a Physical Channel ID it assumes a value of 0xFFFFFFFF.

<16> Section 3.2.5.4: The LAC sends a Receive Window Size AV pair in the OCCN message. The AV pair is sent with the M bit set to 1. The LAC sends the Sequencing Required AV pair in the OCCN message. The behavior of the LNS is defined in section 5.3 of [L2TP-draft].

<17> Section 3.2.5.5: The LAC does not send this message.

<18> Section 3.3.5.1: The LNS sends the Receive Window Size AV pair in the ICRP message if the registry key HKLM\SYSTEM\CurrentControlSet\Control\Class\{4D36E972-E325-11CE-BFC1-08002BE10318}\<Device-number>\PayloadReceiveWindowhas a nonzero value. If the registry key is absent or has value zero, then the LNS does not send the Receive Window Size AV pair in the ICRP message. The LAC, not the LNS, checks for the absence of any of the required AV pairs in the ICRP message returned in response to the ICRQ (see section 6.7 of [RFC2661]).

<19> Section 3.3.5.2: The LNS does not check for the absence of any of the required AV pairs in the ICCN message. If the (Tx) Connect Speed AV pair is absent in the received ICCN message, then the Windows LNS uses 9600 bps as the default value.

The LNS supports only Synchronous Framing. The LNS supports only Synchronous Framing. The behavior when any other value is received in the Framing Type AV pair in the ICCN message depends on the value set for the registry key HKLM\SYSTEM\CurrentControlSet\Control\Class\{4D36E972-E325-11CE-BFC1-08002BE10318}\<Device-number>\IgnoreFramingMismatch, as defined in the following table.

Value	Meaning
Key not present	The error is ignored.
0	Do not ignore framing mismatch. The tunnel is terminated.
Any nonzero value	The error is ignored.

If the Receive Window Size AV pair is not received in the ICCN message, then the LNS does not support sequencing on this call. If the Receive Window Size AV pair is received with value 0, then the LNS uses a Send Window of 10000.

The LNS accepts the Packet Processing Delay AV pair [L2TP-draft] (not as defined in IETF RFC2661) and derives Round Trip milliseconds from the value of this AV pair.

<20> Section 3.3.5.3: The Windows LNS sends the Receive Window Size AV pair with the  $\bf M$  bit set to 1 in the OCRQ message if it is configured to do so.

If the registry key HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\Class\{4D36E972-E325-11CE-BFC1-08002BE10318}\<Device-number>\PayloadReceiveWindow is present and has a non-zero value, then a Receive Window Size ([RFC2661] section 4.4.3) AV pair is sent by the Windows LNS. If this registry key is absent, which is the default case, or if the key has a value of zero, then the Receive Window Size AVPAV pair is not sent.

- <21> Section 3.3.5.4: The Windows LNS disconnects the tunnel by sending a StopCCN message when it receives a zero value for Assigned Session ID AV pair in OCRP message.
- <22> Section 3.3.5.5: Windows LNS does not check for the absence of any of the required AV pairs of the OCCN message.
- <23> Section 3.3.5.6: Windows LNS does not check for the absence of any of the required AV pairs of the WEN message.

# 7 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Description	Revision class
6 Appendix A: Product Behavior	Updated for this version of Windows Server.	Major
