[MS-PCCRD]:

Peer Content Caching and Retrieval: Discovery Protocol

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- Copyrights. This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- No Trade Secrets. Microsoft does not claim any trade secret rights in this documentation.
- Patents. Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft Open Specifications Promise or the Microsoft Community Promise. If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplq@microsoft.com.
- **License Programs**. To see all of the protocols in scope under a specific license program and the associated patents, visit the Patent Map.
- Trademarks. The names of companies and products contained in this documentation might be
 covered by trademarks or similar intellectual property rights. This notice does not grant any
 licenses under those rights. For a list of Microsoft trademarks, visit
 www.microsoft.com/trademarks.
- **Fictitious Names**. The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

Support. For questions and support, please contact dochelp@microsoft.com.

Revision Summary

Date	Revision History	Revision Class	Comments
12/5/2008	0.1	Major	Initial Availability
1/16/2009	0.1.1	Editorial	Changed language and formatting in the technical content.
2/27/2009	0.2	Minor	Clarified the meaning of the technical content.

1 Introduction

The Peer Content Caching & Retrieval: Discovery Protocol is used to locate peers who have the content of interest on a peer-to-peer network. This protocol is used within the Peer Content Caching & Retrieval service framework. The Discovery Protocol is a WS-Discovery based protocol that broadcasts interest in specific content identified by the Content Identification data structure, and clients on the local network that have that content respond.

This Discovery Protocol is based on the Web Service Dynamic Discovery Protocol (also called WSD) [WS-Discovery] standard, with no changes in its protocol syntax and behaviors. Therefore, this document refers to [WS-Discovery] for the detailed specification but provides the product-specific message formats and describes how the Discovery Protocol fits into the overall framework.

The Peer Content Caching and Retrieval Framework is based on a peer-to-peer discovery and distribution model, where the peers themselves act as caches from which they serve other requesting peers. The framework also supports the mode of using pre-provisioned hosted caches in place of peer-based caching. The framework is designed to reduce bandwidth consumption on branch-office wide-area-network (WAN) links by having clients retrieve content from distributed caches, when distributed caches are available, rather than from the content servers, which are often located remotely from branch offices over the WAN links. The main benefit of the framework is to reduce operation costs by reducing WAN link utilization, while providing faster downloads from the local area networks (LANs) in the branch offices.

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

block: A chunk of **content** that composes a **segment**. Each **segment** is divided into one or more **blocks**. Every **block** belongs to a specific **segment**, and within a **segment**, **blocks** are identified by their progressive index. (Block 0 is the first **block** in the **segment**, block 1 is the second, and so on.) See [MS-PCCRC] for more details.

client: For the Peer Content Caching and Retrieval Framework, a client is a client-role peer; that is, a peer that is searching for content, either from the server or from other peers or hosted cashes. In the context of the Retrieval Protocol, a client is a peer that requests a block-range from a server_role_peer. It acts as a Web Services Dynamic Discovery (WS-Discovery) [WS-Discovery] client.

client-role peer: A **peer** that is looking for **content**, either from the server or from other **peers** or hosted caches.

content: Items that correspond to a file that an application attempts to access. Examples of content include web pages and documents stored on either HTTP servers or SMB file servers. Each content item consists of an ordered collection of one or more segments.

content server: The original server that a **peer** contacts to obtain either the hashes of the **content** or the actual **content** when it is not available from the **peers**.

Coordinated Universal Time (UTC): A high-precision atomic time standard that approximately tracks Universal Time (UT). It is the basis for legal, civil time all over the Earth. Time zones around the world are expressed as positive and negative offsets from UTC. In this role, it is also referred to as Zulu time (Z) and Greenwich Mean Time (GMT). In these specifications, all references to UTC refer to the time at UTC-0 (or GMT).

- **globally unique identifier (GUID)**: A term used interchangeably with universally unique identifier (UUID) in Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the value. Specifically, the use of this term does not imply or require that the algorithms described in [RFC4122]] or [C706]] must be used for generating the **GUID**. See also universally unique identifier (UUID).
- hash: A hash, such as SHA-1, on the content or content block.
- **higher-layer application**: An application that uses the Peer Content Caching and Retrieval: Retrieval Protocol, either by itself or as part of the Peer Content Caching and Retrieval Framework or other applications.
- **HoHoDk**: A hash that represents the content-specific label or public identifier that is used to discover **content** from other **peers** or from the hosted cache. This identifier is disclosed freely in broadcast messages. Knowledge of this identifier does not prove authorization to access the actual **content**.
- **multicast**: A style of resource location or a data transmission in which a client makes a request to specific parties on a network simultaneously.
- **network byte order**: The order in which the bytes of a multiple-byte number are transmitted on a network, most significant byte first (in big-endian storage). This may or may not match the order in which numbers are normally stored in memory for a particular processor.
- **peer**: A node participating in the content caching and retrieval system. A peer is a node that both accesses the content and serves the content it caches for other peers.
- **peer-to-peer (P2P)**: An Internet-based networking option in which two or more computers connect directly to each other in order to communicate.
- **probe**: The Web Services Dynamic Discovery (WS-Discovery) protocol message sent by a **client** to discover **content**, as defined in [WS-Discovery1.1].
- **ProbeMatch**: The WSD protocol message sent by a server peer to the requesting **client** when it has the **content** the **client** is looking for.
- **segment**: A unit of content for discovery purposes. A segment is identified on the network by its public identifier, also known as segment ID or HoHoDk. A segment does not belong to any particular content; it can be shared by many content items if all those content items have an identical segment-sized portion at some offset.
- **segment ID (HoHoDk)**: A hash that represents the content-specific label or public identifier that is used to discover content from other peers or from the hosted cache. This identifier is disclosed freely in broadcast messages. Knowledge of this identifier does not prove authorization to access the actual content.
- server peer: A peer that has the content in its local cache and that will serve the content to other peers requesting it. A server peer is acting as a WSD server or service target in the Discovery Protocol.
- **SOAP**: A lightweight protocol for exchanging structured information in a decentralized, distributed environment. **SOAP** uses XML technologies to define an extensible messaging framework, which provides a message construct that can be exchanged over a variety of underlying protocols. The framework has been designed to be independent of any particular programming model and other implementation-specific semantics. SOAP 1.2 supersedes SOAP 1.1. See [SOAP1.2-1/2003].

- **Uniform Resource Identifier (URI)**: A string that identifies a resource. The URI is an addressing mechanism defined in Internet Engineering Task Force (IETF) Uniform Resource Identifier (URI): Generic Syntax [RFC3986].
- **UTF-8**: A byte-oriented standard for encoding Unicode characters, defined in the Unicode standard. Unless specified otherwise, this term refers to the UTF-8 encoding form specified in [UNICODE5.0.0/2007] section 3.9.
- **Web Services Description Language (WSDL)**: An XML format for describing network services as a set of endpoints that operate on messages that contain either document-oriented or procedure-oriented information. The operations and messages are described abstractly and are bound to a concrete network protocol and message format in order to define an endpoint. Related concrete endpoints are combined into abstract endpoints, which describe a network service. WSDL is extensible, which allows the description of endpoints and their messages regardless of the message formats or network protocols that are used.
- **Web Services on Devices (WSD)**: A function-discovery protocol used to discover and communicate certain data structures in a HomeGroup network environment. Implementation details are specified in [DPWS].
- **WS-Discovery**: This term refers to the specific version of the **WS-Discovery** protocol that the implementer is taking a dependency on. This term can refer to any of the supported protocol versions that are specified in section 1.7.
- **WSDL** message: An abstract, typed definition of the data that is communicated during a **WSDL** operation [WSDL]. Also, an element that describes the data being exchanged between web service providers and clients.
- **WSDL operation**: A single action or function of a web service. The execution of a WSDL operation typically requires the exchange of messages between the service requestor and the service provider.
- **XML namespace**: A collection of names that is used to identify elements, types, and attributes in XML documents identified in a URI reference [RFC3986]. A combination of XML namespace and local name allows XML documents to use elements, types, and attributes that have the same names but come from different sources. For more information, see [XMLNS-2ED].
- **XML schema**: A description of a type of XML document that is typically expressed in terms of constraints on the structure and content of documents of that type, in addition to the basic syntax constraints that are imposed by XML itself. An XML schema provides a view of a document type at a relatively high level of abstraction.
- **XML Schema (XSD)**: A language that defines the elements, attributes, namespaces, and data types for XML documents as defined by [XMLSCHEMA1/2] and [W3C-XSD] standards. An XML schema uses XML syntax for its language.
- MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.3 Overview

The Peer Content Caching and Retrieval: Discovery Protocol is based on the Web Services Dynamic Discovery protocol (WSD), defined in [WS-Discovery], which uses multicast to discover and locate services over a peer-to-peer (P2P) network. There are two modes of operations in WSD: client-initiated Probes and service-initiated announcements; both are sent through IP multicast to a predefined group. The Peer Content Caching and Retrieval Discovery Protocol uses the client-initiated Probes to query peer nodes for content.

In the Peer Content Caching and Retrieval Discovery Protocol, the peers looking for content are the WSD clients, sending out multicast WSD Probe messages with the **hashes** of the content. The peers that are serving the content take the server role of WSD, listening to Probes and replying to the querying clients with unicast **ProbeMatch** messages if the content hashes match the ones that are cached locally. To avoid the situation where multiple **server peers** overwhelm a client with

ProbeMatch messages, per the WS-Discovery protocol, each server peer waits for a backoff timer to expire before sending the ProbeMatch. The value of the backoff timer is set randomly between 1 millisecond and a maximum backoff time.

1.4 Relationship to Other Protocols

The Discovery Protocol uses the Web Services Dynamic Discovery protocol, specified in [WS-Discovery], which uses SOAP-over-UDP [SOAP-UDP] [RFC768] as its network transport. In the Windows Peer Content Caching and Retrieval framework, the Discovery Protocol is used by the Peer Content Caching and Retrieval Protocol [MS-PCCRR] to discover other peers that have particular segments of content.

Figure 1: Layering of the protocol stack

1.5 Prerequisites/Preconditions

This protocol depends on the Web Services Dynamic Discovery protocol specified in [WS-Discovery]. The client requesting the discovery is required to have the content information, defined in the Content Information Specification [MS-PCCRC], for the content that it is looking for, and the peers answering the request are required to have a (possibly empty) cache of content that they can check to see if they have the requested content stored locally in order to answer a query.

1.6 Applicability Statement

A client uses the Discovery Protocol to locate peers with the content it requires, in the context of the Peer Content Caching and Retrieval Framework. The protocol is thus appropriate (only) in settings where multiple peers and at least one content server support this framework. It is particularly applicable in cases where the content server is available only over a relatively high-latency or low-bandwidth connection whereas the peers are available over relatively higher-bandwidth, lower-latency ones. In that case, the framework, including this Discovery Protocol, offers the possibility of significant performance benefits.

The Discovery Protocol is used to find peers with the **hashes** listed in the **Probe** messages. It is not for discovering hashes for given names or URLs. It is necessary for the clients to contact the original content servers (as opposed to the peer caches) to obtain the Content Information data structure (see [MS-PCCRC]) containing hashes corresponding to the contents.

1.7 Versioning and Capability Negotiation

The Discovery Protocol is based on the **WSD** standard and does not define any new mechanisms for the following areas:

Supported transports

- Protocol versions
- Security and authentication methods
- Localization
- Capability negotiation

This document defines version 2.0 of the discovery protocol, which preserves the messages from version 1.0 and allows for efficient discovery of multiple **segments**. Capability negotiation is achieved using standard fields of the Web Services Dynamic Discovery (WS-Discovery) protocol.

1.8 Vendor-Extensible Fields

None.

1.9 Standards Assignments

None.

2 Messages

2.1 Transport

The Discovery Protocol uses the Web Services Dynamic Discovery protocol (**WSD**), specified in [<u>WS-Discovery</u>], and the actual transport protocol is abstracted by WSD. The Discovery Protocol simply uses WSD with certain elements set to custom values and relies on WSD for the actual transport of the Receive Probe (section 3.2.4.1) and Receive ProbeMatch (section 3.1.4.1) messages. <1>

2.2 Common Message Syntax

This section contains common definitions used by this protocol. The syntax of the definitions uses **XML** schema as defined in [XMLSCHEMA1.1/2:2008], and **Web Services Description Language** (WSDL) as defined in [WSDL].

Finally, unless specified otherwise, all 2-byte and 4-byte integer fields are defined in **network byte order**.

2.2.1 Namespaces

This specification defines and references various **XML** namespaces using the mechanisms specified in [XMLNS]. Although this specification associates a specific XML namespace prefix for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and is not significant for interoperability.

Because the Discovery Protocol uses the WSD Protocol [WS-Discovery], the namespace requirement will be a subset of the WSD namespaces.

Prefix	Namespace URI	Reference
soap	http://www.w3.org/2003/05/soap-envelope	[SOAP1.2-1/2003]
wsa	http://schemas.xmlsoap.org/ws/2004/08/addressing	[WS-Addr-Core]
wsd	http://schemas.xmlsoap.org/ws/2005/04/discovery	[WS-Discovery]
PeerDist	http://schemas.microsoft.com/p2p/2007/09/PeerDistributionDiscovery	This document

The XML namespace **URI** that MUST be used by the implementation of the Discovery Protocol is as follows.

http://schemas.microsoft.com/p2p/2007/09/PeerDistributionDiscovery

Note The preceding URI does not contain any schema definition. It is used merely as a tag to identify the namespace. All elements related to the preceding namespaces are defined in this document.

2.2.2 Messages

The following table summarizes the set of common **WSDL messages** defined by this specification. WSDL message definitions that are specific to a particular operation are described with the operation.

Message	Description
<u>Probe</u>	Sent by the endpoint to find the services defined by <types> and <scopes>.</scopes></types>

Message	Description
<u>ProbeMatch</u>	Replied by the endpoint that can provide the services defined by <types> and <scopes>.</scopes></types>

Probe and **ProbeMatch** messages must be formatted according to the version 2.0 descriptions when searching for content described by a version 2.0 Content Information structure and MUST be formatted according to the version 1.0 descriptions when searching for content described by a version 1.0 Content Information structure.<2>

2.2.2.1 Probe

The **Probe** [WS-Discovery] message is part of the **WS-Discovery** standard. A **client** sends a **Probe** message to find a specific service defined by **Types** (section 2.2.3.1) and **Scopes** (section 2.2.3.3). The Discovery Protocol uses a **WSD** Probe with the <Types> and <Scopes> elements in the WSD message.

Version 1.0 Probe Message

Version 2.0 Probe Message

Types: The <Types> element, as specified in section 2.2.3.1.

Scopes: The <Scopes> element, as specified in section 2.2.3.3.

2.2.2.2 ProbeMatch

A **ProbeMatch** message SHOULD be sent in response to a <u>Probe</u> message (section 2.2.2.1) if the replying **peer** has the **content segments** listed in the **Probe** message as specified in section <u>3.2.4.1</u>.

Types: The <Types> element, as specified in section 2.2.3.1.

Scopes: The <Scopes> element, as specified in section 2.2.3.3.

Address: The <Address> element, as specified in section 2.2.3.4.

MetadataVersion: The <MetadataVersion> element, as specified in section 2.2.3.5.

InstanceId: The <InstanceId> element, as specified in section 2.2.3.6.

MessageNumber: The <MessageNumber> element, as specified in section 2.2.3.7.

XAddrs: The <XAddrs> element, as specified in section 2.2.3.8.

Any: The <Any> element embedded as <PeerDist:PeerDistData>, as specified in section 2.2.3.9.

2.2.3 Elements

The following table summarizes the set of common **XML** schema elements defined by this specification. XML schema element definitions that are specific to a particular message are described with the message.

Element	Description
<types></types>	Represents the list of discovery provider types.
<scopes></scopes>	Represents the list of discovery provider scopes.
<address></address>	Identifies the responding device.
<metadataversion></metadataversion>	Identifies the current metadata version.
<instanceid></instanceid>	Identifies the current instance of the device being published. This element is part of the SOAP protocol header.
<messagenumber></messagenumber>	Identifies the counter within the scope of the instance identifier for the current message. This element is part of the SOAP protocol header.
<xaddrs></xaddrs>	Contains the list of transport URIs supported by the peer responding to the <u>Probe</u> message (with a <u>ProbeMatch</u> message).
<any></any>	Version 1.0: Used to indicate how many blocks in each discovered segment are available. Version 2.0: Used to indicate the ages of the discovered segments.

2.2.3.1 Types

The <Types> element represents the list of discovery provider types. When specified in the request message, the value indicates the **Types** to be searched for. When specified in the response, the value provides the **Types** that were found. The value of the element is set to indicate that the Probe and Probe Match messages were sent by the Windows Peer Content Caching and Retrieval framework so that it can be checked on the receiving side to confirm this. This element MUST be set to the following.

Version 1.0 <Types> Element

PeerDist:PeerDistData

Version 2.0 <Types> Element

PeerDist:PeerDistDataV2

2.2.3.2 Scopes 1

The <Scopes> element represents the list of discovery provider scopes, where each element in the list is a string.

When specified in the request message, the peer MUST populate this value to indicate the **segments** it is searching for. When sending the response, the value provides the list of scopes present in the cache.

Each element in the list is actually a **UTF-8**-encoded string representation of the **HoHoDk** value in hexBinary format [XMLSCHEMA1.1/2:2008] and represents one segment. (For details of HoHoDk,

refer to [MS-PCCRC].) The Discovery Protocol uses the case-sensitive string comparison rule defined as part of the **WSD** standard schemas. Refer to [WS-Discovery] section 5.1 for details.

2.2.3.3 Scopes 2

The <Scopes> element represents the list of discovery provider scopes, where each element in the list is a string.

Version 1.0 <Scope> Element

When specified in the request message, the version 1.0 **peer** MUST populate this value to indicate the **segments** it is searching for. When sending the response, the value provides the list of scopes present in the cache.

Each element in the list is actually a **UTF-8**-encoded string representation of the **HoHoDk** value in hexBinary format [XMLSCHEMA1.1/2:2008] and represents one segment. (For details of HoHoDk, refer to [MS-PCCRC].) The Discovery Protocol uses the case-sensitive string comparison rule defined as part of the **WSD** standard schemas. Refer to [WS-Discovery] section 5.1 for details.

Version 2.0 <Scope> Element

When specified in the request message, the version 2.0 peer MUST populate this value with a single scope string to indicate the segments it is searching for. The scope string is a UTF-8-encoded string representation in base64Binary format [XMLSCHEMA1.1/2:2008]. The format of the scope string is as follows.

SeamentHashSize (2 bytes): Size of Seament Hash in bytes.

Segment Hash Count (1 byte): Number of Segment Hashes present in the string.

HoHoDk (variable): List of HoHoDks.

Version 2.0 <Scope> element on **ProbeMatch** message.

The <Scope> element of the ProbeMatch message is used to indicate segment availability. This field contains a base64 representation of a bit array encoded as a UTF-8 string. The availability of each HoHoDk is indicated by a two-bit array. The most significant bit in each two-bit array MUST be set to 1 if the responding peer has the requested segment in its cache, and must be set to 0 if the responding peer does not have the segment in its cache. The least significant bit MUST be set to 1 if the responding peer has all blocks belonging to the segment in its cache, and MUST be set to 0 if the responding peer does not have all blocks belonging to the segment in its cache.

2.2.3.4 Address

The <Address> element identifies the responding device. It MUST be set to a **globally unique identifier (GUID)** as a "uuid:" scheme **URI**.<3> The <Address> element is a child element of the <EndpointReference> element. Refer to [WS-Discovery] for the detailed definitions of Address and the "uuid:" scheme URI. The following line shows an example of the **Address** identifier.

urn:uuid:87A89944-0230-43a5-AC4E-FAB1386C8E2C

2.2.3.5 MetadataVersion

The <MetadataVersion> element is the current metadata version and MUST be set to 1 < 4 > or 2 < 5 >

2.2.3.6 InstanceId

The <InstanceId> element is the identifier for the current instance of the device being published. It MUST be generated at run time when the service starts and MUST be incremented whenever the service is restarted. The recommendations on the initial value and processing rules of the **InstanceId** are specified in [WS-Discovery], Appendix I – Application Sequencing. <6>

2.2.3.7 MessageNumber

The <MessageNumber> element is the counter within the scope of the instance identifier for the current message. This MUST be generated at run time, and the **MessageNumber** MUST be incremented for each message. The **MessageNumber** of the first message sent within the scope of the current **InstanceId** SHOULD be "1". Note that the **InstanceId** and the use and increment of the same **MessageNumber** apply to other message types defined in [WS-Discovery] that the applications using the Discovery Protocol can send, not just the <u>ProbeMatch</u> message defined in the Discovery Protocol. The rules on initializing, processing, and incrementing the **MessageNumber** are specified in [WS-Discovery], Appendix I – Application Sequencing.

2.2.3.8 XAddrs

The <XAddrs> element contains the list of transport **URIs** supported by the peer responding to the <u>Probe</u> message (with a <u>ProbeMatch</u> message). Each transport URI string MUST contain an address and port number that can be used for connection by a remote host. For detailed format specifications on transport URIs containing IP addresses and port numbers, see <u>[RFC3986]</u>.

2.2.3.9 Any

Version 1.0 <Any> element

A custom XML section MUST be embedded in the <Any> element of the WSD message body.

This field is used to indicate how many **blocks** in each discovered **segment** are available. The XML MUST be formatted as follows.

PeerDistData: This element encloses all the custom metadata for Version 1.0 responses.

BlockCount: This element is a child of the <PeerDistData> element. This element is set to the **UTF-8**-encoded string representation of the hexBinary [XMLSCHEMA1.1/2:2008] packed array of integers in **network byte order**. Each integer represents a block count. For example, if there are three block counts with the decimal values 25, 4, and 16, the hexBinary value of these block counts is 001900040010, corresponding to the three segments discovered.

Version 2.0 <Any> element

This field is used to indicate the ages for the discovered segments. The XML MUST be formatted as follows.

```
<PeerDist:PeerDistData>
     <PeerDist: SegmentAges>
        List of-Segment Ages
     </PeerDist:SegmentAges>
</PeerDist:PeerDistData>
```

PeerDistData: This element encloses all custom metadata for Version 2.0 responses.

SegmentAges: This element is a child of the <PeerDistData> element. This field contains a base 64 representation of a bit array encoded as a UTF-8 string. For more details about the format of the **SegmentAges** field, see [MS-PCCRR].

2.2.4 Complex Types

This specification does not define any common XML Schema complex type definitions.

2.2.5 Simple Types

This specification does not define any common XML Schema simple type definitions.

2.2.6 Attributes

This specification does not define any common XML Schema attribute definitions.

2.2.7 Groups

This specification does not define any common XML Schema group definitions.

2.2.8 Attribute Groups

This specification does not define any common XML Schema attribute group definitions.

3 Protocol Details

The Discovery Protocol utilizes the **Probe** and **ProbeMatch** messages from the **WSD** Protocol. Refer to [WS-Discovery] for the detailed protocol operation. This section describes how the Probe and ProbeMatch messages are used in the Discovery Protocol.

3.1 Client Details

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The following is a list of the abstract data model elements for the protocol state on the client or the requesting **peer**:

HoHoDk List: A list of the segment IDs/HoHoDks of the segments that the peer is searching for.

Outstanding Probe List: A list of currently outstanding **Probes**, together with the HoHoDks contained in them.

APP_MAX_DELAY: The maximum time a server peer can wait before sending a ProbeMatch message.

3.1.2 Timers

The **client peer** MUST set a request timer when sending a **Probe** message to wait for a certain period of time for the incoming replies. The request timer is configurable such that system administrators can adjust the value based on their current network environments. The default value of the request timer is in the range of 200 milliseconds to 500 milliseconds, and under all circumstances, the waiting period SHOULD NOT be smaller than the maximum backoff timer value as defined in section <u>3.2.2</u> to ensure that enough replies are received by a requesting peer. When the request timer expires on a requesting peer without receiving any **ProbeMatch** replies, the implementation MUST remove that Probe message and its associated **HoHoDk List** from the **Outstanding Probe List**.

3.1.3 Initialization

The elements for the **Probe** message MUST be initialized according to their corresponding values or rules, as specified in section 2.2.2.1.

The **HoHoDk List** (or **segment ID** list) on the requesting peer MUST be initialized with values supplied by applications using the Discovery Protocol. This list consists of the **HoHoDks** passed by the applications through the interface of the Discovery Protocol as specified in section <u>1.4</u>.

3.1.4 Message Processing Events and Sequencing Rules

The following table summarizes the list of client WSDL operations as defined by this specification.

Operation	Description
Receive ProbeMatch	Triggered by the WSD layer on receiving a response to a Probe message.

3.1.4.1 Receive ProbeMatch

This event is triggered by the **WSD** layer on receiving a response to a **Probe** as specified in section 3.2.4.1. The peer that receives a <u>ProbeMatch</u> message MUST check the <Types> and <XAddrs> elements to verify that the response was sent by a peer on the local subnet, and it MUST check the HoHoDks to verify that at least one is associated with a <u>Probe</u> message on the **Outstanding Probe List**. If so, it MUST report the IP address and the port number from the <XAddrs> element of the **ProbeMatch** message and the relevant HoHoDk from the <Scopes> element of the ProbeMatch message to the higher layer.

All malformed ProbeMatch messages MUST be silently discarded.

3.1.5 Timer Events

When the request timer for a specific **Probe** message expires on the requesting peer, that Probe message and its associated **HoHoDk List** are removed from the **Outstanding Probe List**.

3.1.6 Other Local Events

All malformed messages destined for the Peer Content Caching and Retrieval framework MUST be silently discarded. All **WSD** messages destined for other services will be dispatched by the WSD service to other registered components for the specific service types. For general WSD message processing and error handling, refer to [WS-Discovery].

3.1.6.1 Discovery Probe Started

To start a Discovery **Probe**, the higher layer passes one or more **segment HoHoDks** from the **content** it is looking for to the **client-role peer**, which sends out a WSD Probe message that is modified, as specified in section <u>2.2.2.1</u>. It then adds the Probe together with its HoHoDks to the **Outstanding Probe List** and sets the request timer for this Probe.

3.2 Server Details

3.2.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The following abstract data model is required on the **server peer**:

Available Segment List: A list of all **HoHoDks** for all available **segments**, and their corresponding block counts.

3.2.2 Timers

The **server peer** MUST set a backoff timer (defined and explained in [WS-Discovery]) randomly between 1 millisecond and a maximum value (defined by the WSD Protocol constant APP_MAX_DELAY). If the server peer has the requested **segment IDs** in the request, the server MUST send the **ProbeMatch** message back to the requesting peer when the backoff timer expires. If the server peer does not have the requested segment IDs, the server MUST ignore the request. For a

detailed description of the backoff timer, see [WS-Discovery]. This timer is configurable such that system administrators can adjust the value based on their current network environments. By default, **APP_MAX_DELAY** SHOULD be set to 65 milliseconds.<a href="mailto:system-network-networ

3.2.3 Initialization

The **server peers** MUST initialize an empty **Available Segment List** and populate the list with the **HoHoDks** supplied by the **higher-layer applications** of the Discovery Protocol. The server peers MUST also generate and set the initial values for <u>Address (section 2.2.3.4)</u>, InstanceId (section 2.2.3.6), and MessageNumber (section 2.2.3.7).

3.2.4 Message Processing Events and Sequencing Rules

The following table summarizes the list of server **WSDL** operations as defined by this specification.

Operation	Description
Receive Probe	Triggered by the WSD layer on receiving a <u>Probe</u> message.

3.2.4.1 Receive Probe

This event is triggered by the **WSD** layer on receiving a **Probe** message. The event processing involves checking the <Types> and <Scopes> elements to verify that the Probe was initiated by a **peer**. The peer then SHOULD respond to the Probe if one or more **HoHoDks** in the Probe match any that are stored locally. <8>

If none of the HoHoDks stored locally match the ones in the Probe message, the Probe message MUST be silently discarded.

If the peer responds to the Probe, it MUST first retrieve the corresponding block counts for the stored segments whose HoHoDks match the ones in the Probe message. It MUST then construct and send the ProbeMatch message (as defined in section 2.2.2.2) back to the requesting peer, using the correct block counts.

All malformed Probe messages MUST be silently discarded. A Probe having an empty or an incorrectly formatted <Scope> element is considered as a malformed Probe message.

3.2.5 Timer Events

The behavior of the backoff timer is described in <a>[WS-Discovery].

3.2.6 Other Local Events

All malformed messages destined for the Windows Peer Content Caching and Retrieval framework MUST be silently discarded. All **WSD** messages destined for other services will be dispatched by the WSD service to other registered components for the specific service types. For general WSD message processing and error handling, refer to [WS-Discovery].

3.2.6.1 Segment ID Added or Removed

When the higher-layer protocol or applications of the Discovery Protocol add or remove a **segment ID/HoHoDk**, the **server peer** MUST update its **Available Segment List** accordingly, with the updated segment IDs supplied by the higher-layer protocol or application.

4 Protocol Examples

4.1 Version 1.0 Probe Message

A **client** node in a branch office contacts a Peer Content Caching and Retrieval–capable **content server** to retrieve a webpage, http://vortex.example.com/sample.html. It receives a list of hashes that represent the indices of the **content**. The client then sends the following **WSD Probe** message.

```
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope"</pre>
 xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing"
 xmlns:wsd="http://schemas.xmlsoap.org/ws/2005/04/discovery"
 xmlns:PeerDist=
"http://schemas.microsoft.com/p2p/2007/09/PeerDistributionDiscovery">
 <soap:Header>
   <wsa:To>
     urn:schemas-xmlsoap-org:ws:2005:04:discovery
   </wsa:To>
   <wsa:Action>
     http://schemas.xmlsoap.org/ws/2005/04/discovery/Probe
   </wsa:Action>
   <wsa:MessageID>
     urn:uuid:91528b47-b96d-4e30-981f-308c0586926f
   </wsa:MessageID>
 </soap:Header>
 <soap:Body>
   <wsd:Probe>
     <wsd:Types>
       PeerDist:PeerDistData
     </wsd:Types>
     <wsd:Scopes
              MatchBy=
       "http://schemas.xmlsoap.org/ws/2005/04/discovery/strcmp0">
</wsd:Scopes>
   </wsd:Probe>
 </soap:Bodv>
</soap:Envelope>
```

The <Types> and <Scopes> elements contain the Discovery Protocol-specific values. The <Scopes> element in this example shows only one **HoHoDk**.

4.2 Version 2.0 Probe Message

Version 2.0 Probe message

```
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope"
   xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing"
   xmlns:wsd="http://schemas.xmlsoap.org/ws/2005/04/discovery"
   xmlns:PeerDist=
"http://schemas.microsoft.com/p2p/2007/09/PeerDistributionDiscovery">
   <soap:Header>
   <wsa:To>
        urn:schemas-xmlsoap-org:ws:2005:04:discovery
   </wsa:To>
   <wsa:Action>
        http://schemas.xmlsoap.org/ws/2005/04/discovery/Probe
   </wsa:Action>
   <wsa:Action>
   <wsa:MessageID>
        urn:uuid:91528b47-b96d-4e30-981f-308c0586926f
```

The <scopes> element in this example contains the following values:

```
Segment Hash Size = 32 Bytes
Segment Hash Count = 2
HoHoDK 1 = 23BE1A0100000000301D1A010000000410041004400790067004D004D003100
HoHoDK 2 = 23BE1A0100000000301D1A010000000410041004400790067004D004D003100
```

Other **peer** nodes that receive this **Probe** message check whether the **HoHoDks** in the Probe identify a **segment** at least some blocks of which are available locally. If a match is found, the node sets a backoff timer and replies with the **ProbeMatch** message after the timer expires, as described in section 4.3 for version 1.0 and 4.4 for version 2.0.

4.3 Version 1.0 ProbeMatch Message

Version 1.0 ProbeMatch message

```
<?xml version="1.0" encoding="utf-8"?>
  <soap:Envelope xmlns:soap=http://www.w3.org/2003/05/soap-envelope</pre>
    xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing"
    xmlns:wsd="http://schemas.xmlsoap.org/ws/2005/04/discovery"
    xmlns:PeerDist=
      "http://schemas.microsoft.com/p2p/2007/09/PeerDistributionDiscovery
    <soap:Header>
      <wsa:To>
     http://schemas.xmlsoap.org/ws/2004/08/addressing/role/anonymous
      </wsa:To>
      <wsa:Action>
      http://schemas.xmlsoap.org/ws/2005/04/discovery/ProbeMatches
      </wsa:Action>
      <wsa:MessageID>
        urn:uuid:7f4b09a3-96c9-4170-9eb3-1c805a52f444
      </wsa:MessageID>
      <wsa:RelatesTo>
        urn:uuid:91528b47-b96d-4e30-981f-308c0586926f
      </wsa:RelatesTo>
      <wsd:AppSequence InstanceId="1218765447" MessageNumber="4"/>
    </soap:Header>
    <soap:Body>
      <wsd:ProbeMatches>
        <wsd:ProbeMatch>
          <wsa:EndpointReference>
            <wsa:Address>
              urn:uuid:87A89944-0230-43a5-AC4E-FAB1386C8E2C
            </wsa:Address>
          </wsa:EndpointReference>
          <wsd:Types>
```

```
PeerDist:PeerDistData
       </wsd:Types>
       <wsd:Scopes>
</wsd:Scopes>
       <wsd:XAddrs>
        157.59.141.183:54321
       </wsd:XAddrs>
       <wsd:MetadataVersion>
       </wsd:MetadataVersion>
       <PeerDist:PeerDistData>
        <PeerDist:BlockCount>
          0000002A
        </PeerDist:BlockCount>
       </PeerDist:PeerDistData>
     </wsd:ProbeMatch>
    </wsd:ProbeMatches>
   </soap:Body>
 </soap:Envelope>
```

The <Types>, <Scopes>, <XAddrs>, and <MetadataVersion> elements contain the appropriate Discovery Protocol-specific values. The block of syntax for the <PeerDist:PeerDistData> element following after the <MetadataVersion> element contains the block counts for the segment referred to in the <Scopes> element.

4.4 Version 2.0 ProbeMatch Message

Version 2.0 ProbeMatch message

```
<?xml version="1.0" encoding="utf-8"?>
  <soap:Envelope xmlns:soap=http://www.w3.org/2003/05/soap-envelope</pre>
    xmlns:wsa="http://schemas.xmlsoap.org/ws/2004/08/addressing"
    xmlns:wsd="http://schemas.xmlsoap.org/ws/2005/04/discovery"
    xmlns:PeerDist=
      "http://schemas.microsoft.com/p2p/2007/09/PeerDistributionDiscovery
    <soap:Header>
      <wsa:To>
    http://schemas.xmlsoap.org/ws/2004/08/addressing/role/anonymous
      </wsa:To>
      <wsa:Action>
      http://schemas.xmlsoap.org/ws/2005/04/discovery/ProbeMatches
      </wsa:Action>
      <wsa:MessageID>
        urn:uuid:7f4b09a3-96c9-4170-9eb3-1c805a52f444
      </wsa:MessageID>
      <wsa:RelatesTo>
        urn:uuid:91528b47-b96d-4e30-981f-308c0586926f
      </wsa:RelatesTo>
      <wsd:AppSequence InstanceId="1218765447" MessageNumber="4"/>
    </soap:Header>
    <soap:Body>
      <wsd:ProbeMatches>
        <wsd:ProbeMatch>
          <wsa:EndpointReference>
            <wsa:Address>
              urn:uuid:87A89944-0230-43a5-AC4E-FAB1386C8E2C
            </wsa:Address>
          </wsa:EndpointReference>
          <wsd:Types>
            PeerDist:PeerDistDataV2
          </wsd:Types>
          <wsd:Scopes>
```

```
///////////w==
          </wsd:Scopes>
          <wsd:XAddrs>
            157.59.141.183:54321
          </wsd:XAddrs>
          <wsd:MetadataVersion>
           2
          </wsd:MetadataVersion>
          <PeerDist:PeerDistData>
           <PeerDist:SegmentAges>
           AAEDAgBg6gACYOoA
           </PeerDist:SegmentAges>
          </PeerDist:PeerDistData>
        </wsd:ProbeMatch>
      </wsd:ProbeMatches>
    </soap:Body>
  </soap:Envelope>
```

The <Scopes> element in this example indicates the availability of 40 complete segments. The <PeerDist:SegmentAges> element indicates ages for segments 1 and 3.

5 Security

The **WSD** messages are **multicast** on the local subnet. Because the Discovery Protocol works on top of the Web Services Dynamic Discovery Protocol specified in <u>[WS-Discovery]</u>, it leverages the security model of WSD. In addition, the Discovery Protocol rejects responses from any subnet other than the local subnet. For more information about the security model of WSD, see [WS-Discovery].

5.1 Security Considerations for Implementers

None.

5.2 Index of Security Parameters

None.

6 Appendix A: Full WSDL

This protocol follows the Web Services Dynamic Discovery protocol specified in [WS-Discovery]. Its Web Services Description Language [WSDL] is identical to that of WS-Discovery.

7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- Windows Vista operating system
- Windows Server 2008 operating system
- Windows 7 operating system
- Windows Server 2008 R2 operating system
- Windows 8 operating system
- Windows Server 2012 operating system
- Windows 8.1 operating system
- Windows Server 2012 R2 operating system
- Windows 10 operating system
- Windows Server 2016 operating system
- Windows Server operating system

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> Section 2.1: For Windows Vista and Windows Server 2008, support for the client-side elements of this protocol is available only via the optional installation of the Background Intelligent Transfer Service by way of the Windows Management Framework. Support for the server-side elements of this protocol is not available for Windows Vista or Windows Server 2008.

<2> Section 2.2.2: Version 2.0 of the Content Information structure is not supported by Windows 7 and Windows Server 2008 R2.

<3> Section 2.2.3.4: Windows generates a new GUID for the URI when the service starts.

<4> Section 2.2.3.5: MetadataVersion MUST be set to 1 Windows Vista, Windows Server 2008, Windows 7, and Windows Server 2008 R2.

<<u>5> Section 2.2.3.5</u>: MetadataVersion MUST be set to 2 for Windows, except for Windows Vista, Windows Server 2008, Windows 7, and Windows Server 2008 R2.

<a><6> Section 2.2.3.6: In Windows 7 and Windows Server 2008 R2 operating system, the InstanceId is generated by taking the boot time of the service in seconds since 1970-01-01 Time 00:00:00 UTC.

<7> Section 3.2.2: In Windows 7 and Windows Server 2008 R2, the default value for the request timer is 300 milliseconds, and the default maximum backoff timer value on the server peer is 65 milliseconds. However, these two values are configurable in Windows 7 and Windows Server 2008 R2 and can be set by system administrators based on the specific network environment.

<8> Section 3.2.4.1: In Windows 7 and Windows Server 2008 R2, the following rules are used to determine whether a server peer will reply to a **Probe** message when it has the requested segment.

When the server peer first requests and downloads a segment as a client, it records the number of replies it receives and whether the replies contain the entire segment or just a portion of the segment. Later, when the server peer receives a Probe message for that segment, it proceeds as follows (where n is an administratively configurable parameter with the default value n = 10):

- If there were fewer than n replies, the server peer will respond to the new Probe after the backoff timer expires.
- If there were at least n replies:
 - If there were at least n full-segment replies, the server peer will not reply to the new Probe.
 - If there were fewer than n full-segment replies, the server peer will randomly determine whether to reply to the new Probe, with a probability of 0.33 for replying.

8 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Description	Revision class
Z Appendix B: Product Behavior	Added Windows Server to the applicable products list.	Major
