

[MS-UAMG]: Update Agent Management Protocol

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft [Open Specification Promise](#) or the [Community Promise](#). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

Revision Summary

Date	Revision History	Revision Class	Comments
12/18/2009	0.1	Major	First Release.
01/29/2010	0.1.1	Editorial	Revised and edited the technical content.
03/12/2010	1.0	Major	Updated and revised the technical content.
04/23/2010	2.0	Major	Updated and revised the technical content.
06/04/2010	2.1	Minor	Updated the technical content.
07/16/2010	3.0	Major	Significantly changed the technical content.
08/27/2010	3.1	Minor	Clarified the meaning of the technical content.
10/08/2010	3.1	No change	No changes to the meaning, language, or formatting of the technical content.
11/19/2010	3.2	Minor	Clarified the meaning of the technical content.
01/07/2011	3.2	No change	No changes to the meaning, language, or formatting of the technical content.
02/11/2011	3.2	No change	No changes to the meaning, language, or formatting of the technical content.
03/25/2011	3.2	No change	No changes to the meaning, language, or formatting of the technical content.
05/06/2011	3.2	No change	No changes to the meaning, language, or formatting of the technical content.
06/17/2011	3.3	Minor	Clarified the meaning of the technical content.
09/23/2011	3.3	No change	No changes to the meaning, language, or formatting of the technical content.
12/16/2011	4.0	Major	Significantly changed the technical content.
03/30/2012	4.0	No change	No changes to the meaning, language, or formatting of the technical content.
07/12/2012	5.0	Major	Significantly changed the technical content.
10/25/2012	5.0	No change	No changes to the meaning, language, or formatting of the technical content.
01/31/2013	5.0	No change	No changes to the meaning, language, or formatting of the technical content.
08/08/2013	6.0	Major	Significantly changed the technical content.

1 Introduction

The Update Agent Management Protocol uses DCOM as its transport layer. It provides a set of types and interfaces that allow callers to manage an **update agent** and to invoke some update agent operations, such as an update search.

Sections 1.8, 2, and 3 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in RFC 2119. Sections 1.5 and 1.9 are also normative but cannot contain those terms. All other sections and examples in this specification are informative.

1.1 Glossary

The following terms are defined in [\[MS-GLOS\]](#):

endpoint (2)
globally unique identifier (GUID)
Interface Definition Language (IDL)
Microsoft Interface Definition Language (MIDL)
Network Data Representation (NDR)
opnum
remote procedure call (RPC)
universally unique identifier (UUID)

The following terms are specific to this document:

automatic update agent: An **automatic update agent** is a subcomponent of or a component in addition to the **update agent**, which automatically and periodically triggers the **update agent** to perform operations such as search. A single **update service** is registered with an **automatic update agent**, on which all automatic operations are performed.

category: A group of updates. Each update belongs to zero or more update **categories**. An update **category** can be a product category that contains updates for a particular product, or a classification category that contains updates of a particular classification (for example, all security updates). A **category** can have a parent **category** as well as child **categories**.

Common Vulnerabilities and Exposures (CVE) ID: Described in [\[CVE\]](#).

delta compression: **Delta compression** is a form of compression used to reduce the amount of data downloaded in order to create updated files on the **update agent** computer.

root category: A **category** that does not have a parent.

scan package: A file containing metadata for a set of updates. An **update agent** can treat this as a virtual **update service** against which the **update agent** can perform update searches.

update agent: A software component on a computer that communicates with one or more **update services** in order to search for updates applicable to the computer.

update service: A server or service that responds to communication initiated by **update agents** in order to provide update metadata for applicable updates.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

References to Microsoft Open Specifications documentation do not include a publishing year because links are to the latest version of the documents, which are updated frequently. References to other documents include a publishing year when one is available.

A reference marked "(Archived)" means that the reference document was either retired and is no longer being maintained or was replaced with a new document that provides current implementation details. We archive our documents online [\[Windows Protocol\]](#).

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information. Please check the archive site, <http://msdn2.microsoft.com/en-us/library/E4BD6494-06AD-4aed-9823-445E921C9624>, as an additional source.

1.3 Overview

The Update Agent Management Protocol defines a set of types and interfaces that allow clients to manage an update agent. The protocol implements two primary classes of functionality: (1) managing the set of **update services** registered with an update agent and (2) performing an update search with the update agent and returning the results.

The client and server can be on the same machine, or they can be on different machines connected by a network. A client can use the functionality provided by this protocol to perform an update search on the server machine against an update service of the client's choice.

1.4 Relationship to Other Protocols

The Update Agent Management Protocol uses the Distributed Component Object Model (DCOM) Remote Protocol, as specified in [\[MS-DCOM\]](#).

Additionally, it uses types and interfaces defined by the OLE Automation Protocol, as specified in [\[MS-OAUT\]](#).

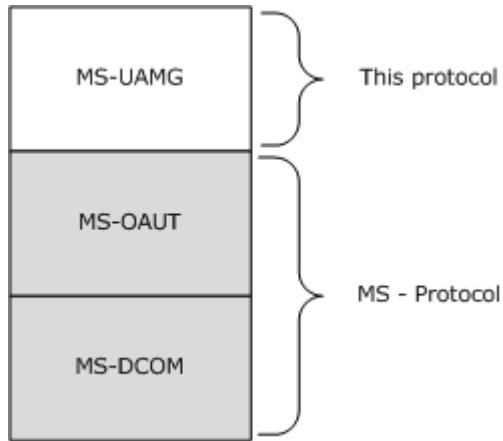

Figure 1: Relationship between protocols related to the Update Agent Management Protocol

1.5 Prerequisites/Preconditions

The DCOM Remote Protocol, as specified in [\[MS-DCOM\]](#), and the OLE Automation Protocol, as specified in [\[MS-OAUT\]](#), needs to be installed on both the client and the server.

The update agent needs to be able to communicate and perform update synchronizations with its update service.

1.6 Applicability Statement

The Update Agent Management Protocol is useful for managing the set of update services registered with an update agent and for performing an update search on the server machine, especially in situations where the client is running on a different machine than the server.

1.7 Versioning and Capability Negotiation

This document covers versioning issues in the following areas:

- **Localization:** The server side of this protocol can return localized data from various methods, including text strings and **IImageInformation** instances, which represent localized images.
- **Capability Negotiation:** Some interfaces defined by this protocol form inheritance chains: for example, the **IAutomaticUpdatesSettings**, **IAutomaticUpdatesSettings2**, and **IAutomaticUpdatesSettings3** interfaces. It is recommended that the server implement all three interfaces, but it can implement only a subset. A caller can determine whether an interface is supported by calling the **IUnknown::QueryInterface** method.

1.8 Vendor-Extensible Fields

This protocol uses **HRESULT** values as defined in [\[MS-ERREF\]](#) section 2.1. Vendors can define their own **HRESULT** values, provided that they set the C bit (0x20000000) for each vendor-defined value, indicating the value is a customer code.

1.9 Standards Assignments

The following **globally unique identifiers (GUIDs)** are used by the Update Agent Management Protocol.

Constant/value	Description
CLSID_AutomaticUpdates {BFE18E9C-6D87-4450-B37C-E02F0B373803}	The GUID associated with the object implementing the IAutomaticUpdates interface.
CLSID_InstallationAgent {317E92FC-1679-46FD-A0B5-F08914DD8623}	The GUID associated with the object implementing the IInstallationAgent interface.
CLSID_StringCollection {72C97D74-7C3B-40AE-B77D-ABDB22EBA6FB}	The GUID associated with the object implementing the IStringCollection interface.
CLSID_UpdateCollection {13639463-00DB-4646-803D-528026140D88}	The GUID associated with the object implementing the IUpdateCollection interface.
CLSID_UpdateDownloader {5BAF654A-5A07-4264-A255-9FF54C7151E7}	The GUID associated with the object implementing the IUpdateDownloader interface.
CLSID_UpdateInstaller {D2E0FE7F-D23E-48E1-93C0-6FA8CC346474}	The GUID associated with the object implementing the IUpdateInstaller interface.
CLSID_UpdateSearcher {B699E5E8-67FF-4177-88B0-3684A3388BFB}	The GUID associated with the object implementing the IUpdateSearcher interface.
CLSID_UpdateServiceManager	The GUID associated with the object implementing the

Constant/value	Description
{F8D253D9-89A4-4DAA-87B6-1168369F0B21}	IUpdateServiceManager interface.
CLSID_UpdateSession {4CB43D7F-7EEE-4906-8698-60DA1C38F2FE}	The GUID associated with the object implementing the IUpdateSession interface.
CLSID_WindowsUpdateAgentInfo {C2E88C2F-6F5B-4AAA-894B-55C847AD3A2D}	The GUID associated with the object implementing the IWindowsUpdateAgentInfo interface.
IID_IStringCollection {EFF90582-2DDC-480F-A06D-60F3FBC362C3}	The GUID associated with the IStringCollection interface.
IID_IAutomaticUpdatesResults {E7A4D634-7942-4DD9-A111-82228BA33901}	The GUID associated with the IAutomaticUpdatesResults interface.
IID_IAutomaticUpdatesSettings {2EE48F22-AF3C-405F-8970-F71BE12EE9A2}	The GUID associated with the IAutomaticUpdatesSettings interface.
IID_IAutomaticUpdatesSettings2 {6ABC136A-C3CA-4384-8171-CB2B1E59B8DC}	The GUID associated with the IAutomaticUpdatesSettings2 interface.
IID_IAutomaticUpdatesSettings3 {B587F5C3-F57E-485F-BBF5-0D181C5CD0DC}	The GUID associated with the IAutomaticUpdatesSettings3 interface.
IID_IAutomaticUpdates {673425BF-C082-4C7C-BDFD-569464B8E0CE}	The GUID associated with the IAutomaticUpdates interface.
IID_IAutomaticUpdates2 {4A2F5C31-CFD9-410E-B7FB-29A653973A0F}	The GUID associated with the IAutomaticUpdates2 interface.
IID_IUpdateIdentity {46297823-9940-4C09-AED9-CD3EA6D05968}	The GUID associated with the IUpdateIdentity interface.
IID_IImageInformation {7C907864-346C-4AEB-8F3F-57DA289F969F}	The GUID associated with the IImageInformation interface.
IID_ICategory {81DDC1B8-9D35-47A6-B471-5B80F519223B}	The GUID associated with the ICategory interface.
IID_ICategoryCollection {3A56FBF8-576C-43F7-9335-FE4838FD7E37}	The GUID associated with the ICategoryCollection interface.

Constant/value	Description
IID_IInstallationBehavior {D9A59339-E245-4DBD-9686-4D5763E39624}	The GUID associated with the IInstallationBehavior interface.
IID_IUpdateDownloadContent {54A2CB2D-9A0C-48B6-8A50-9ABB69EE2D02}	The GUID associated with the IUpdateDownloadContent interface.
IID_IUpdateDownloadContent2 {C97AD11B-F257-420B-9D9F-377F733F6F68}	The GUID associated with the IUpdateDownloadContent2 interface.
IID_IUpdateDownloadContentCollection {BC5513C8-B3B8-4BF7-A4D4-361C0D8C88BA}	The GUID associated with the IUpdateDownloadContentCollection interface.
IID_IUpdate {6A92B07A-D821-4682-B423-5C805022CC4D}	The GUID associated with the IUpdate interface.
IID_IUpdate2 {144fe9b0-d23d-4a8b-8634-fb4457533b7a}	The GUID associated with the IUpdate2 interface.
IID_IUpdate3 {112EDA6B-95B3-476F-9D90-AEE82C6B8181}	The GUID associated with the IUpdate3 interface.
IID_IUpdate4 {27E94B0D-5139-49A2-9A61-93522DC54652}	The GUID associated with the IUpdate4 interface.
IID_IUpdate5 {C1C2F21A-D2F4-4902-B5C6-8A081C19A890}	The GUID associated with the IUpdate5 interface.
IID_IWindowsDriverUpdateEntryCollection {0D521700-A372-4bef-828B-3D00C10ADEBD}	The GUID associated with the IWindowsDriverUpdateEntryCollection interface.
IID_IWindowsDriverUpdateEntry {ED8BFE40-A60B-42ea-9652-817DFCFA23EC}	The GUID associated with the IWindowsDriverUpdateEntry interface.
IID_IWindowsDriverUpdate {B383CD1A-5CE9-4504-9F63-764B1236F191}	The GUID associated with the IWindowsDriverUpdate interface.
IID_IWindowsDriverUpdate2 {615c4269-7a48-43bd-96b7-bf6ca27d6c3e}	The GUID associated with the IWindowsDriverUpdate2 interface.
IID_IWindowsDriverUpdate3 {49EBD502-4A96-41BD-9E3E-}	The GUID associated with the IWindowsDriverUpdate3 interface.

Constant/value	Description
4C5057F4250C}	
IID_IWindowsDriverUpdate4 {004C6A2B-0C19-4c69-9F5C-A269B2560DB9}	The GUID associated with the IWindowsDriverUpdate4 interface.
IID_IWindowsDriverUpdate5 {70CF5C82-8642-42bb-9DBC-0CFD263C6C4F}	The GUID associated with the IWindowsDriverUpdate5 interface.
IID_IUpdateCollection {07F7438C-7709-4CA5-B518-91279288134E}	The GUID associated with the IUpdateCollection interface.
IID_IUpdateException {A376DD5E-09D4-427F-AF7C-FED5B6E1C1D6}	The GUID associated with the IUpdateException interface.
IID_IUpdateExceptionCollection {A37D00F5-7BB0-4953-B414-F9E98326F2E8}	The GUID associated with the IUpdateExceptionCollection interface.
IID_ISearchResult {D40CFF62-E08C-4498-941A-01E25F0FD33C}	The GUID associated with the ISearchResult interface.
IID_IUpdateHistoryEntry {BE56A644-AF0E-4E0E-A311-C1D8E695CBFF}	The GUID associated with the IUpdateHistoryEntry interface.
IID_IUpdateHistoryEntry2 {C2BFB780-4539-4132-AB8C-0A8772013AB6}	The GUID associated with the IUpdateHistoryEntry2 interface.
IID_IUpdateHistoryEntryCollection {A7F04F3C-A290-435B-AADE-A116C3357A5C}	The GUID associated with the IUpdateHistoryEntryCollection interface.
IID_IUpdateSearcher {8F45ABF1-F9AE-4B95-A933-F0F66E5056EA}	The GUID associated with the IUpdateSearcher interface.
IID_IUpdateSearcher2 {4CBDCB2D-1589-4BEB-BD1C-3E582FF0ADD0}	The GUID associated with the IUpdateSearcher2 interface.
IID_IUpdateSearcher3 {04C6895D-EAF2-4034-97F3-311DE9BE413A}	The GUID associated with the IUpdateSearcher3 interface.
IID_IUpdateSession {816858A4-260D-4260-933A-2585F1ABC76B}	The GUID associated with the IUpdateSession interface.

Constant/value	Description
IID_IUpdateSession2 {91CAF7B0-EB23-49ED-9937-C52D817F46F7}	The GUID associated with the IUpdateSession2 interface.
IID_IUpdateSession3 {918EFD1E-B5D8-4c90-8540-AEB9BDC56F9D}	The GUID associated with the IUpdateSession3 interface.
IID_IUpdateService {76B3B17E-AED6-4DA5-85F0-83587F81ABE3}	The GUID associated with the IUpdateService interface.
IID_IUpdateService2 {1518B460-6518-4172-940F-C75883B24CEB}	The GUID associated with the IUpdateService2 interface.
IID_IUpdateServiceCollection {9B0353AA-0E52-44FF-B8B0-1F7FA0437F88}	The GUID associated with the IUpdateServiceCollection interface.
IID_IUpdateServiceRegistration {DDE02280-12B3-4E0B-937B-6747F6ACB286}	The GUID associated with the IUpdateServiceRegistration interface.
IID_IUpdateServiceManager {23857E3C-02BA-44A3-9423-B1C900805F37}	The GUID associated with the IUpdateServiceManager interface.
IID_IUpdateServiceManager2 {0BB8531D-7E8D-424F-986CA0B8F60A3E7B}	The GUID associated with the IUpdateServiceManager2 interface.
IID_IWindowsUpdateAgentInfo {85713FA1-7796-4FA2-BE3B-E2D6124DD373}	The GUID associated with the IWindowsUpdateAgentInfo interface.

2 Messages

2.1 Transport

This protocol uses the Distributed Component Object Model (DCOM) Remote Protocol, as defined in [\[MS-DCOM\]](#) section 1.3.

To access an interface, the client MUST request a DCOM connection to its well-known object UUID endpoint on the server, as defined in [\[MS-DCOM\]](#) section 1.9.

2.2 Common Data Types

This protocol MUST indicate to the remote procedure call (RPC) runtime that it is to support the NDR transfer syntax only, as specified in Part 4 of [\[C706\]](#).

In addition to RPC base types and definitions specified in [\[C706\]](#) and [\[MS-RPCE\]](#), additional data types are defined in this section.

This protocol references commonly used data types as defined in [\[MS-DTYP\]](#).

Unless otherwise qualified, instances of **GUID** refer to [\[MS-DTYP\]](#) section 2.3.4.

2.2.1 InstallationImpact

The **InstallationImpact** enumeration defines values that describe the level of impact resulting from installing or uninstalling an update.

```
typedef enum tagInstallationImpact
{
    iiNormal = 0,
    iiMinor = 1,
    iiRequiresExclusiveHandling = 2
} InstallationImpact;
```

iiNormal: Installing or uninstalling an update results in a level of impact on the target computer that is typical of most updates.

iiMinor: Installing or uninstalling an update results in an insignificant impact on the target computer. For example, this can apply to an update to the signatures of an antivirus application.

iiRequiresExclusiveHandling: Installing or uninstalling an update results in such a high impact on the target computer that the update must be installed or uninstalled exclusively. For example, this value can apply to a major update such as an operating system service pack.

2.2.2 InstallationRebootBehavior

The **InstallationRebootBehavior** enumeration defines values that describe the reboot behavior of installing or uninstalling an update.

```
typedef enum tagInstallationRebootBehavior
{
    irbNeverReboots = 0,
    irbAlwaysRequiresReboot = 1,
```

```
    irbCanRequestReboot = 2
} InstallationRebootBehavior;
```

irbNeverReboots: The update never requires a system restart during or after an installation or an uninstallation.

irbAlwaysRequiresReboot: The update always requires a system restart after a successful installation or uninstallation.

irbCanRequestReboot: The update might or might not require a system restart after an installation or uninstallation. The need to restart is determined after the update is installed or uninstalled.

2.2.3 UpdateType

The **UpdateType** enumeration defines values that describe the type of an update.

```
typedef enum tagUpdateType
{
    utSoftware = 1,
    utDriver = 2
} UpdateType;
```

utSoftware: Indicates that the update is a software update.

utDriver: Indicates that the update is a driver update.

2.2.4 DeploymentAction

The **DeploymentAction** enumeration defines values that describe the server-defined action to be taken on the update by the update agent.

```
typedef enum tagDeploymentAction
{
    daNone = 0,
    daInstallation = 1,
    daUninstallation = 2,
    daDetection = 3
} DeploymentAction;
```

daNone: The update inherits the deployment action from its bundled updates.

daInstallation: The update SHOULD be installed on the computer and/or for the specified user.

daUninstallation: The update SHOULD be uninstalled from the computer and/or for the specified user.

daDetection: The update is deployed only to determine the applicability of the update. The update SHOULD NOT be installed.

2.2.5 DownloadPriority

The **DownloadPriority** enumeration defines values describing the recommended download priority of an update. It is up to the update agent implementation to define the relative differences between download priority levels.[<1>](#)

```
typedef enum tagDownloadPriority
{
    dpLow = 1,
    dpNormal = 2,
    dpHigh = 3,
    dpExtraHigh = 4
} DownloadPriority;
```

dpLow: The update service recommends that the update agent SHOULD use fewer resources to download the update than it uses for updates with dpNormal or dpHigh priority.

dpNormal: The update service recommends that the update agent SHOULD use more resources to download the update than it uses for updates with dpLow priority, but fewer resources than it uses for updates with dpHigh priority.

dpHigh: The update service recommends that the update agent SHOULD use more resources to download the update than it uses for updates with dpLow or dpNormal priority.

dpExtraHigh: The update service recommends that the update agent SHOULD use all available resources to download the update as quickly as possible.

2.2.6 AutoSelectionMode

The **AutoSelectionMode** enumeration defines values describing the recommendation for whether an update is automatically selected in a user interface (UI).

```
typedef enum tagAutoSelectionMode
{
    asLetWindowsUpdateDecide = 0,
    asAutoSelectIfDownloaded = 1,
    asNeverAutoSelect = 2,
    asAlwaysAutoSelect = 3
} AutoSelectionMode;
```

asLetWindowsUpdateDecide: The update service recommends that a user interface implementation SHOULD decide whether to automatically select the update. This decision is implementation-specific and may involve other properties of the update and/or the administrator's configuration of the user interface. [<2>](#)

asAutoSelectIfDownloaded: The update service recommends that a user interface implementation SHOULD automatically select the update if the update is already downloaded.

asNeverAutoSelect: The update service recommends that a user interface implementation SHOULD NOT automatically select the update.

asAlwaysAutoSelect: The update service recommends that a user interface implementation SHOULD automatically select the update.

2.2.7 AutoDownloadMode

The **AutoDownloadMode** enumeration defines values describing the recommendation for whether an update should be downloaded automatically by an update agent.

```
typedef enum tagAutoDownloadMode
{
    adLetWindowsUpdateDecide = 0,
    adNeverAutoDownload = 1,
    adAlwaysAutoDownload = 2
} AutoDownloadMode;
```

adLetWindowsUpdateDecide: The update service recommends that the update agent SHOULD decide on its own whether to automatically download the update. This decision is implementation-specific and may involve other properties of the update and/or the administrator's configuration of the update agent .In Windows, the update agent has an option to allow automatic download of important updates and another option to allow automatic download of recommended updates.[<3>](#)

adNeverAutoDownload: The update service recommends that the update agent SHOULD NOT automatically download the update.

adAlwaysAutoDownload: The update service recommends that the update agent SHOULD automatically download the update.

2.2.8 UpdateExceptionContext

The **UpdateExceptionContext** enumeration defines values that describe the context in which an error has occurred.

```
typedef enum tagUpdateExceptionContext
{
    uecGeneral = 1,
    uecWindowsDriver = 2,
    uecWindowsInstaller = 3
} UpdateExceptionContext;
```

uecGeneral: The exception is not tied to any context.

uecWindowsDriver: The exception is related to one or more Windows drivers.

uecWindowsInstaller: The exception is related to Windows Installer.

2.2.9 OperationResultCode

The **OperationResultCode** enumeration defines values that describe the result of an update operation.

```
typedef enum tagOperationResultCode
{
    orcNotStarted = 0,
    orcInProgress = 1,
    orcSucceeded = 2,
    orcSucceededWithErrors = 3,
    orcFailed = 4,
```

```
    orcAborted = 5
} OperationResultCode;
```

orcNotStarted: The operation is not started.

orcInProgress: The operation is in progress.

orcSucceeded: The operation was completed successfully.

orcSucceededWithErrors: The operation is complete, but one or more errors occurred during the operation. The results might be incomplete.

orcFailed: The operation failed to complete.

orcAborted: The operation is canceled.

2.2.10 UpdateOperation

The **UpdateOperation** enumeration defines values that describe the type of an update operation.

```
typedef enum tagUpdateOperation
{
    uoInstallation = 1,
    uoUninstallation = 2
} UpdateOperation;
```

uoInstallation: Install the update on the target computer.

uoUninstallation: Uninstall the update from the target computer.

2.2.11 ServerSelection

The **ServerSelection** enumeration defines values that describe the type of server to use for an update search operation.

```
typedef enum tagServerSelection
{
    ssDefault = 0,
    ssManagedServer = 1,
    ssWindowsUpdate = 2,
    ssOthers = 3
} ServerSelection;
```

ssDefault: Search the default server for updates that match the search criteria.

ssManagedServer: Search only the managed server for updates that match the search criteria.

ssWindowsUpdate: Search the Windows Update service over the Internet.

ssOthers: Search another server, to be specified by other means.

2.2.12 SearchScope

The **SearchScope** enumeration defines values that describe the combination of per-user and per-machine updates for which to search.

```
typedef enum tagSearchScope
{
    searchScopeDefault = 0,
    searchScopeMachineOnly = 1,
    searchScopeCurrentUserOnly = 2,
    searchScopeMachineAndCurrentUser = 3,
    searchScopeMachineAndAllUsers = 4,
    searchScopeAllUsers = 5
} SearchScope;
```

searchScopeDefault: Use the default search scope defined by the update agent. This SHOULD be equivalent to **searchScopeMachineOnly**.

searchScopeMachineOnly: Search for per-machine update only.

searchScopeCurrentUserOnly: Search for per-user updates for the calling user only.

searchScopeMachineAndCurrentUser: Search for per-machine updates and per-user updates for the calling user.

searchScopeMachineAndAllUsers: Search for per-machine updates and per-user updates for all users.

searchScopeAllUsers: Search for per-user updates for all users.

2.2.13 UpdateServiceRegistrationState

The **UpdateServiceRegistrationState** enumeration defines values that describe the state of a service's registration.

```
typedef enum tagUpdateServiceRegistrationState
{
    usrsNotRegistered = 1,
    usrsRegistrationPending = 2,
    usrsRegistered = 3
} UpdateServiceRegistrationState;
```

usrsNotRegistered: The service is not registered.

usrsRegistrationPending: The service is pending registration. Registration will be attempted the next time that the update agent contacts an update service.

usrsRegistered: The service is registered.

2.2.14 UpdateServiceOption

The **UpdateServiceOption** enumeration defines values that control how an update service is removed.

```
typedef [public] enum tagUpdateServiceOption
```

```
{
    usoNonVolatileService = 0x00000001
} UpdateServiceOption;
```

usoNonVolatileService: The service is to be treated as nonvolatile; removal of the service requires an explicit call to do so.

2.2.15 AddServiceFlag

The **AddServiceFlag** enumeration defines values that control how an update service is registered.

```
typedef [public] enum tagAddServiceFlag
{
    asfAllowPendingRegistration = 0x00000001,
    asfAllowOnlineRegistration = 0x00000002,
    asfRegisterServiceWithAU = 0x00000004
} AddServiceFlag;
```

asfAllowPendingRegistration: Allows the update agent to process the service registration at a later time if the service registration cannot be performed before returning from the [IUpdateServiceManager2::AddService2 \(opnum 18\) \(section 3.44.5.4\)](#) method call.

asfAllowOnlineRegistration: Allows the update agent to process the service registration during the [IUpdateServiceManager2::AddService2 \(opnum 18\)](#) method call if network connectivity is available.

asfRegisterServiceWithAU: Registers the service with the **automatic update agent** when the service is added.

2.2.16 DECIMAL

The **DECIMAL** structure ([\[MS-OAUT\]](#) section 2.2.26) specifies a sign and scale for a number. Decimal variables are represented as 96-bit unsigned integers that are scaled by a variable power of 10.

This type is declared as follows:

```
typedef DECIMAL DECIMAL;
```

wReserved: MUST be set to 0x0000.

scale: MUST be set to 0x00.

sign: MUST be set to 0x00.

Hi32: MUST be set to 0x00000000.

Lo64: Contains the 64-bit unsigned integer to be returned to the client.

3 Protocol Details

The client side of this protocol is simply a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

3.1 Relationships Between Servers

Several servers in this protocol are related by composition. The following diagram illustrates these relationships. Note that the interface members have been omitted from the diagram for clarity.

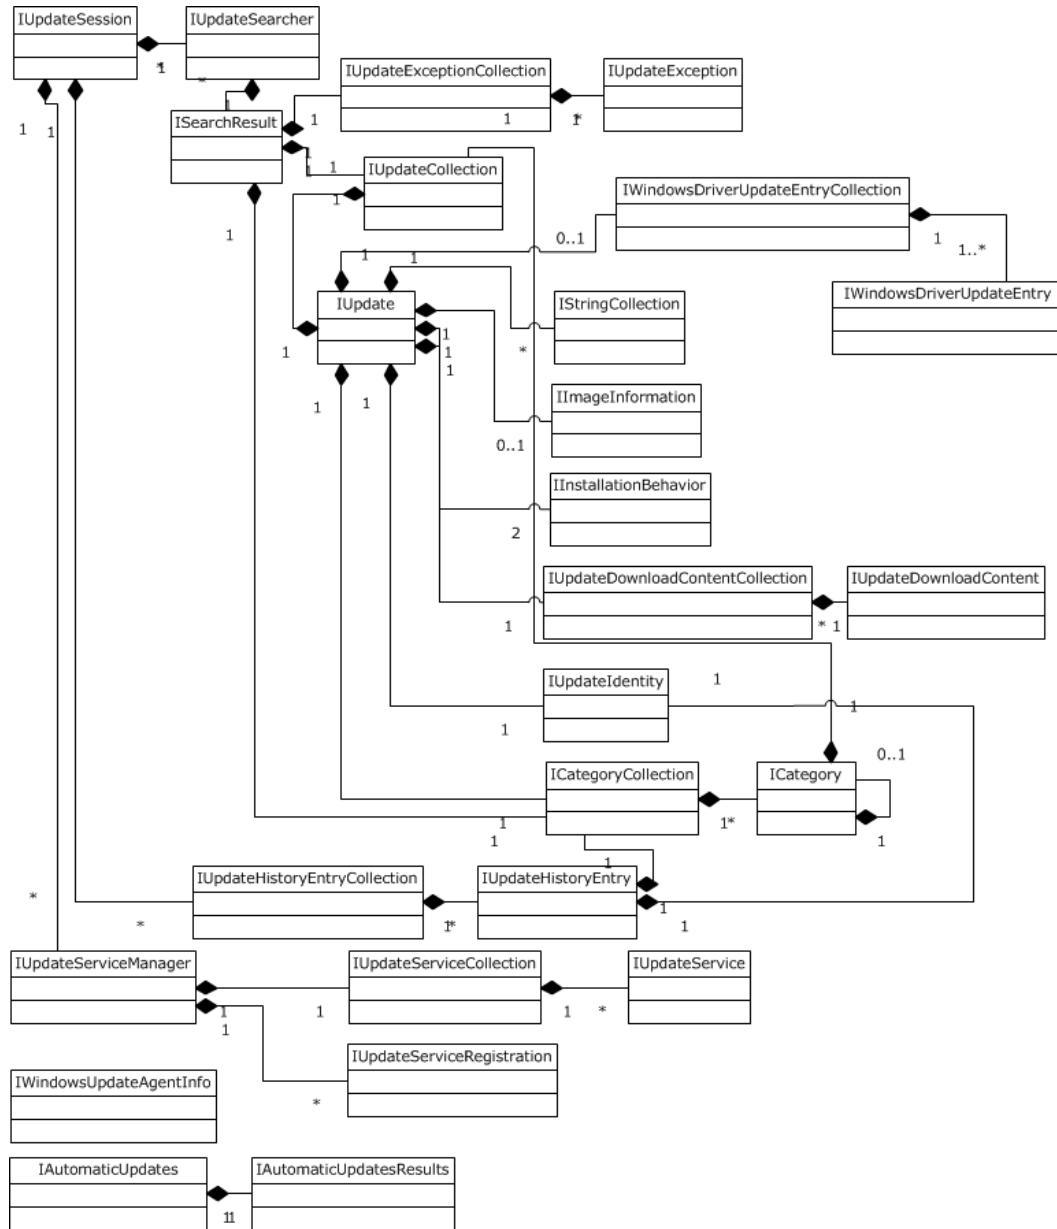

Figure 2: Composition relationships between servers

3.2 IAutomaticUpdatesResults Server Details

The **IAutomaticUpdatesResults** interface derives from the **IDispatch** interface and represents an immutable record of the most recent results of operations performed by an automatic update agent.

3.2.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IAutomaticUpdatesResults** server maintains the following data elements:

- **LastSearchSuccessDate:** A **DATE** ([\[MS-OAUT\]](#) section 2.2.24) structure set to the date-time of the last successful search initiated by the automatic update agent.
- **LastInstallationSuccessDate:** A **DATE** ([\[MS-OAUT\]](#) section 2.2.24) structure set to the date-time of the last successful installation or uninstallation initiated by the automatic update agent.

Once initialized, these data elements are never modified or reinitialized.

3.2.2 Timers

None.

3.2.3 Initialization

When the server is created, the server's abstract data model (ADM) elements SHOULD be populated with current data. This data is obtained from the update agent through an implementation-dependent interface.[<4>](#)

3.2.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
LastSearchSuccessDate	Retrieves the date-time of the most recent successful search done by the automatic update agent. Opnum: 8
LastInstallationSuccessDate	Retrieves the date-time of the most recent successful installation done by the automatic update agent. Opnum: 9

All methods MUST NOT throw exceptions.

3.2.4.1 IAutomaticUpdatesResults::LastSearchSuccessDate (Opnum 8)

The **IAutomaticUpdatesResults::LastSearchSuccessDate** (opnum 8) method retrieves the date-time of the most recent successful search done by the automatic update agent.

```
HRESULT LastSearchSuccessDate(
    [out, retval] VARIANT* retval
);
```

retval: If the date-time for the last successful update search is not known, the **vt** field MUST be set to VT_EMPTY. Otherwise, the **vt** member MUST be set to VT_DATE, and the date-time of the last successful update search MUST be stored in the **date** field.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return a VARIANT containing the value of the **LastSearchSuccessDate** ADM element.

3.2.4.2 IAutomaticUpdatesResults::LastInstallationSuccessDate (Opnum 9)

The **IAutomaticUpdatesResults::LastInstallationSuccessDate** (opnum 9) method retrieves the date-time of the most recent successful installation done by the automatic update agent.

```
HRESULT LastInstallationSuccessDate(
    [out, retval] VARIANT* retval
);
```

retval: If the date-time for the last successful update search is not known, the **vt** field MUST be set to VT_EMPTY. Otherwise, the **vt** member MUST be set to VT_DATE, and the date-time of the last successful update installation MUST be stored in the **date** field.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return a VARIANT containing the value of the **LastInstallationSuccessDate** ADM element.

3.2.5 Timer Events

None.

3.2.6 Other Local Events

None.

3.3 IAutomaticUpdatesResults Client Details

3.3.1 Abstract Data Model

None.

3.3.2 Timers

None.

3.3.3 Initialization

None.

3.3.4 Message Processing Events and Sequencing Rules

To retrieve an **IAutomaticUpdatesResults** instance, a client MUST call the [**IAutomaticUpdates2::Results \(opnum 15\) \(section 3.4.5.1\)**](#) method.

3.3.5 Timer Events

None.

3.3.6 Other Local Events

None.

3.4 IAutomaticUpdates and IAutomaticUpdates2 Server Details

The **IAutomaticUpdates** interface derives from the **IDispatch** interface and represents an automatic update agent. It defines methods to notify the automatic update agent to start a search. The **IAutomaticUpdates2** interface derives from **IAutomaticUpdates** and defines additional methods for interacting with an automatic update agent.

3.4.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IAutomaticUpdates** and **IAutomaticUpdates2** server maintains the following data element:

Results: An **IAutomaticUpdateResults** instance containing the results of the most recent operations performed by the automatic update agent.

Once initialized, this data element is never modified or reinitialized.

3.4.2 Timers

None.

3.4.3 Initialization

When the server is created, an instance of the **IAutomaticUpdateResults** interface SHOULD be created and stored in the **Results** ADM element.

3.4.4 Message Processing Events and Sequencing Rules for IAutomaticUpdates

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
DetectNow	Notifies the automatic update agent to begin an update search. Opnum: 8
Opnum9NotUsedOnWire	Reserved for local use. Opnum: 9
Opnum10NotUsedOnWire	Reserved for local use. Opnum: 10
Opnum11NotUsedOnWire	Reserved for local use. Opnum: 11
Opnum12NotUsedOnWire	Reserved for local use. Opnum: 12
Opnum13NotUsedOnWire	Reserved for local use. Opnum: 13
Opnum14NotUsedOnWire	Reserved for local use. Opnum: 14

In the table above, the term "Reserved for local use" means that the client MUST NOT send the opnum, and the server behavior is undefined [⟨5⟩](#) since it does not affect interoperability.

All methods MUST NOT throw exceptions.

3.4.4.1 IAutomaticUpdates::DetectNow (Opnum 8)

The **IAutomaticUpdates::DectectNow** method notifies the automatic update agent to begin an update search.

```
HRESULT DetectNow();
```

This method has no parameters.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD trigger the automatic update agent to perform an update search.

3.4.5 Message Processing Events and Sequencing Rules for **IAutomaticUpdates2**

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Results	Retrieves an IAutomaticUpdatesResults instance. Opnum: 15

All methods MUST NOT throw exceptions.

3.4.5.1 **IAutomaticUpdates2::Results (Opnum 15)**

The **IAutomaticUpdates2::Results (opnum 15)** method retrieves an **IAutomaticUpdatesResults** instance.

```
HRESULT Results(
    [out, retval] IAutomaticUpdatesResults** retval
);
```

retval: MUST be set to an instance of the **IAutomaticUpdatesResults** interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Results** ADM element.

3.4.6 Timer Events

3.5 IAutomaticUpdates and IAutomaticUpdates2 Client Details

3.5.1 Abstract Data Model

None.

3.5.2 Timers

None.

3.5.3 Initialization

None.

3.5.4 Message Processing Events and Sequencing Rules

To retrieve an **IAutomaticUpdates** instance, a client MUST directly create an object that implements the **IAutomaticUpdates** interface.

To retrieve an **IAutomaticUpdates2** instance, a client MUST directly create an object that implements the **IAutomaticUpdates2** interface.

3.5.5 Timer Events

None.

3.5.6 Other Local Events

None.

3.6 ICatgeory Server Details

The **ICatgeory** interface derives from the **IDispatch** interface and is an immutable representation of an update **category**.

3.6.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **ICatgeory** server maintains the following data elements:

- **Locale:** An [LCID](#) identifying the locale for localized strings maintained by this ADM.
- **Name:** A string containing the update category's localized name.
- **ID:** A string uniquely identifying the category.

- **Children:** An **ICategoryCollection** instance containing its child categories.
- **Description:** A string containing the category's localized description.
- **Image:** A localized **IImageInformation** instance representing the image associated with this category.
- **Order:** An integer indicating the category's recommended display order in a graphical user interface (GUI) among its siblings.
- **Parent:** An **ICategory** instance representing the category's parent category.
- **Type:** A string describing the category's type.
- **Updates:** An **IUpdateCollection** instance containing the updates found during an update search that belong to this category.

Once initialized, these data elements are not modified.

3.6.2 Timers

None.

3.6.3 Initialization

When an **ICategory** instance is created, it SHOULD^{<6>} obtain the value of the creating server's **Locale** ADM element through an implementation-dependent interface and store it in its own **Locale** ADM element. It SHOULD^{<7>} then populate the remaining ADM elements from category metadata obtained from the update agent through an implementation-dependent interface. Localized strings SHOULD^{<8>} be loaded in the locale identified by the **Locale** ADM element.

3.6.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
<u>Name</u>	Retrieves the name of the update category. Opnum: 8
<u>CategoryID</u>	Retrieves the ID of the category. Opnum: 9
<u>Children</u>	Retrieves an ICategoryCollection interface instance containing the children of the category. Opnum: 10
<u>Description</u>	Retrieves the description of the category. Opnum: 11
<u>Image</u>	Retrieves an IImageInformation interface instance containing information on the image

Method	Description
	associated with the category. Opnum: 12
<u>Order</u>	Retrieves the recommended display order of the category among its siblings. Opnum: 13
<u>Parent</u>	Retrieves the parent of the category. Opnum: 14
<u>Type</u>	Retrieves the type of the category. Opnum: 15
<u>Updates</u>	Retrieves an IUpdateCollection interface instance containing the updates that immediately belong to the category. Opnum: 16

All methods MUST NOT throw exceptions.

3.6.4.1 ICategory::Name (Opnum 8)

The **ICategory::Name (opnum 8)** method retrieves the name of the update category.

```
HRESULT Name(
    [out, retval] BSTR* retval
);
```

retval: The localized name of the category.

Return Values: The method MUST return information in an **HRESULT** data structure, defined in [\[MS-ERREF\]](#) section 2.1. The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Name** ADM element.

3.6.4.2 ICategory:: CategoryID (Opnum 9)

The **ICategory:: CategoryID (opnum 9)** method retrieves the ID of the update category.

```
HRESULT CategoryID(
    [out, retval] BSTR* retval
);
```

retval: A globally unique string identifying this category.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ID** ADM element.

3.6.4.3 ICategory::Children (Opnum 10)

The **ICategory::Children (opnum 10)** method retrieves an **ICategoryCollection** interface instance containing the children of the update category.

```
HRESULT Children(
    [out, retval] ICategoryCollection** retval
);
```

retval: An instance of the **ICategoryCollection** interface that contains the categories that are children of this category.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Children** ADM element.

3.6.4.4 ICategory::Description (Opnum 11)

The **ICategory::Description (opnum 11)** method retrieves the description of the update category.

```
HRESULT Description(
    [out, retval] BSTR* retval
);
```

retval: MUST be set to a string containing the description of the category, or MUST be set to NULL or the empty string if there is no description for the category.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Description** ADM element.

3.6.4.5 ICategory::Image (Opnum 12)

The **ICategory::Image (opnum 12)** method retrieves an **IImageInformation** interface instance that contains information on the image associated with the update category.

```
HRESULT Image(
    [out, retval] IImageInformation** retval
);
```

retval: MUST be set to an instance of **IImageInformation** that describes the image associated with the category, or MUST be set to NULL if no image is associated with the category.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Image** ADM element.

3.6.4.6 ICategory::Order (Opnum 13)

The **ICategory::Order (opnum 13)** method retrieves the recommended display order of the update category among its siblings.

```
HRESULT Order(
    [out, retval] LONG* retval
);
```

retval: MUST be set to a value indicating the recommended display order of this category among its siblings. A category with a lesser **Order** value is recommended to be displayed before a category with a greater **Order** value.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Order** ADM element.

3.6.4.7 ICategory::Parent (Opnum 14)

The **ICategory::Parent (opnum 14)** method retrieves the parent of the update category.

```
HRESULT Parent(
    [out, retval] ICategory** retval
);
```

retval: MUST be set to an instance of the **ICategory** interface representing this category's parent category, or MUST be set to NULL if this category is the **root category**.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Parent** ADM element.

3.6.4.8 ICategory::Type (Opnum 15)

The **ICategory::Type (opnum 15)** method retrieves the type of the update category.

```
HRESULT Type(
    [out, retval] BSTR* retval
);
```

retval: A string containing the type of this category. The string MUST be set to one of the following values:

- "Company", if this category refers to the company or organization that has public ownership and support accountability for the updates belonging to the category.
- "ProductFamily", if this category refers to a related set of products.
- "Product", if this category refers to a single product.
- "UpdateClassification", for all other cases.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Type** ADM element.

3.6.4.9 ICategory::Updates (Opnum 16)

The **ICategory::Updates (opnum 16)** method retrieves an **IUpdateCollection** interface containing the updates that belong to the update category.

```
HRESULT Updates(
    [out, retval] IUpdateCollection** retval
);
```

retval: An instance of **IUpdateCollection** containing updates belonging to this category.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Updates** ADM element.

3.8 ICategoryCollection Server Details

The **ICategoryCollection** interface derives from the **IDispatch** interface and represents an immutable collection of **ICategory** instances.

3.8.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **ICategoryCollection** server maintains the following data elements:

- **Locale**: An [LCID](#) identifying the locale for localized data.
- **List**: An ordered list of **ICategory** instances.
- **Count**: An integer set to the count of the number of items in **List**.

Once initialized, these data elements are not modified.

3.8.2 Timers

None.

3.8.3 Initialization

When the server is created, it SHOULD^{<9>} obtain the value of the creating server's **Locale** ADM element through an implementation-dependent interface and store it in its own **Locale** ADM element. Its remaining ADM elements SHOULD^{<10>} be populated with category data obtained from the update agent through an implementation-dependent interface.

3.8.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Item	Retrieves an item by index. Opnum: 8
NewEnum	Retrieves an enumerator that can be used to enumerate the collection of ICategory instances. Opnum: 9
Count	Retrieves a count of the number of items in the collection. Opnum: 10

All methods MUST NOT throw exceptions.

3.8.4.1 ICategoryCollection::Item (Opnum 8)

The **ICategoryCollection::Item** (opnum 8) method retrieves an item by index.

```
HRESULT Item(
    [in] LONG index,
    [out, retval] ICategory** retval
);
```

index: The zero-indexed position of the item to retrieve.

retval: The [ICategory](#) at the given index.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the given index is less than 0x00000000 or greater than or equal to the number of items in the collection, the method MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the item in the **List** ADM element at the given index.

3.8.4.2 ICategoryCollection::_NewEnum (Opnum 9)

The **ICategoryCollection::_NewEnum** (opnum 9) method retrieves an enumerator that can be used to enumerate the collection of **ICategory** instances.

```
HRESULT _NewEnum(
    [out, retval] IUnknown** retval
);
```

retval: The **IUnknown** interface of an object that implements the **IEnumVARIANT** interface, which can be used to enumerate the elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD create a new object that implements the **IEnumVARIANT** interface and enumerates over the **List** ADM element.

3.8.4.3 ICategoryCollection::Count (Opnum 10)

The **ICategoryCollection::Count** (opnum 10) method retrieves a count of the number of items in the collection of **ICategory** instances.

```
HRESULT Count(
    [out, retval] LONG* retval
);
```

retval: A count of the elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Count** ADM element.

3.10 IIImageInformation Server Details

The **IIImageInformation** interface derives from the **IDispatch** interface and is an immutable representation of a localized image that is associated with an update or category.

3.10.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IIImageInformation** server maintains the following data elements:

Locale: An [LCID](#) identifying the locale for localized strings maintained by this ADM.

Height: An integer set to the height of the image, in pixels.

Width: An integer set to the width of the image, in pixels.

Source: A string containing the URL of the image.

AltText: A string containing the localized alternate text for the image.

Once initialized, these data elements are never modified or reinitialized.

3.10.2 Timers

None.

3.10.3 Initialization

When an **IIImageInformation** instance is created, it SHOULD obtain the desired locale for localized data from the creating server through an implementation-dependent interface and store that in the **Locale** ADM element. It SHOULD then populate the remaining ADM elements from update metadata obtained from the update agent through an implementation-dependent interface. Localized data SHOULD be loaded in the locale identified by the **Locale** ADM element.[<11>](#)

3.10.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
AltText	Retrieves the alternate text for the image. Opnum: 8
Height	Retrieves the height of the image, in pixels. Opnum: 9
Source	Retrieves the source location of the image. Opnum: 10
Width	Retrieves the width of the image, in pixels. Opnum: 11

All methods MUST NOT throw exceptions.

3.10.4.1 IImageInformation::AltText (Opnum 8)

The **IImageInformation::AltText (opnum 8)** method retrieves the alternate text for the image.

```
HRESULT AltText(
    [out, retval] BSTR* retval
);
```

retval: A string containing the alternate text for the image.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The **server** SHOULD return the value of the **AltText** ADM element.

3.10.4.2 IImageInformation::Height (Opnum 9)

The **IImageInformation::Height (opnum 9)** method retrieves the height of the image, in pixels.

```
HRESULT Height(
    [out, retval] LONG* retval
);
```

retval: The height of the image, in pixels.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.

- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Height** ADM element.

3.10.4.3 **IImageInformation::Source (Opnum 10)**

The **IImageInformation::Source (opnum 10)** method retrieves the source location of the image.

```
HRESULT Source(
    [out, retval] BSTR* retval
);
```

retval: A URL that specifies the location of the image.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Source** ADM element.

3.10.4.4 **IImageInformation::Width (Opnum 11)**

The **IImageInformation::Width (opnum 11)** method retrieves the width of the image, in pixels.

```
HRESULT Width(
    [out, retval] LONG* retval
);
```

retval: The width of the image, in pixels.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Width** ADM element.

3.12 IInstallationBehavior Server Details

The **IInstallationBehavior** interface derives from the **IDispatch** interface and represents an immutable description of the behavior of an update installation or uninstallation operation.

3.12.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IInstallationBehavior** server maintains the following data elements:

- **CanRequestUserInput:** A VARIANT_BOOL that indicates whether the operation can request user input.
- **Impact:** A value from the [**InstallationImpact \(section 2.2.1\)**](#) enumeration that describes the impact of the operation.

- **RebootBehavior:** A value from the [InstallationRebootBehavior \(section 2.2.2\)](#) enumeration that describes the reboot behavior of the operation.
- **RequiresNetworkConnectivity:** A VARIANT_BOOL that indicates whether the operation requires network connectivity.

Once initialized, these data elements are never modified.

3.12.2 Timers

None.

3.12.3 Initialization

When the server is created, its ADM elements SHOULD[<12>](#) be initialized from update metadata obtained from the update agent through an implementation-dependent interface.

3.12.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section [3](#).

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
CanRequestUserInput	Retrieves whether the operation can request user input. Opnum: 8
Impact	Retrieves an enumeration value that describes the impact of the installation or uninstallation operation on the computer. Opnum: 9
RebootBehavior	Retrieves an enumeration value that describes the likelihood that a reboot is needed for this operation. Opnum: 10
RequiresNetworkConnectivity	Retrieves whether the operation requires network connectivity. Opnum: 11

All methods MUST NOT throw exceptions.

3.12.4.1 IInstallationBehavior::CanRequestUserInput (Opnum 8)

The **IInstallationBehavior::CanRequestUserInput (opnum 8)** method retrieves whether the operation can request user input.

```
HRESULT CanRequestUserInput(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the operation can request user input or to VARIANT_FALSE if the operation never requests user input.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **CanRequestUserInput** ADM element.

3.12.4.2 **IInstallationBehavior::Impact (Opnum 9)**

The **IInstallationBehavior::Impact (opnum 9)** method retrieves an enumeration value that describes the impact of the installation or uninstallation operation on the computer.

```
HRESULT Impact(
    [out, retval] InstallationImpact* retval
);
```

retval: An [InstallationImpact \(section 2.2.1\)](#) instance that indicates the impact of the operation.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Impact** ADM element.

3.12.4.3 **IInstallationBehavior::RebootBehavior (Opnum 10)**

The **IInstallationBehavior::RebootBehavior (opnum 10)** method retrieves an enumeration value that describes the likelihood that a reboot is needed for this operation.

```
HRESULT RebootBehavior(
    [out, retval] InstallationRebootBehavior* retval
);
```

retval: An [InstallationRebootBehavior \(section 2.2.2\)](#) instance that specifies the reboot behavior of the operation.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.

- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **RebootBehavior** ADM element.

3.12.4.4 IInstallationBehavior::RequiresNetworkConnectivity (Opnum 11)

The **IInstallationBehavior::RequiresNetworkConnectivity (opnum 11)** method retrieves whether the operation can require network connectivity.

```
HRESULT RequiresNetworkConnectivity(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the operation can require network connectivity or to VARIANT_FALSE if the operation never requires network connectivity.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **RequiresNetworkConnectivity** ADM element.

3.13.4 Message Processing Events and Sequencing Rules

To retrieve an **IInstallationBehavior** instance, a client MUST call one of the following methods:

- [**IUpdate::InstallationBehavior \(opnum 22\)**](#)
- [**IUpdate::UninstallationBehavior \(opnum 45\)**](#)

3.13.5 Timer Events

None.

3.13.6 Other Local Events

None.

3.14 ISearchResult Server Details

The **ISearchResult** interface derives from the **IDispatch** interface and represents an immutable record of the results of a search operation.

3.14.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **ISearchResult** server maintains the following data elements:

- **Locale:** An [**LCID**](#) identifying the locale for localized data.
- **resultCode:** A value from the [**OperationResultCode \(section 2.2.9\)**](#) enumeration that describes the overall result of the search operation.
- **RootCategories:** An **ICategoryCollection** collection containing root categories.
- **Updates:** An **IUpdateCollection** containing updates found during the search operation.
- **Warnings:** An **IUpdateExceptionCollection** containing warnings generated during the search operation.

Once initialized, these data elements are never modified.

3.14.2 Timers

None.

3.14.3 Initialization

When the server is created, it SHOULD obtain the value of the creating server's **Locale** ADM element through an implementation-dependent[**<13>**](#) interface and store it in its own **Locale** ADM element. Its remaining ADM elements SHOULD be initialized using the results of the search operation performed by the update agent. The results of the search are obtained from the update agent through an implementation-dependent[**<14>**](#) interface.

3.14.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
ResultCode	Retrieves the result code for the search. Opnum: 8
RootCategories	Retrieves the root categories found during the search. Opnum: 9
Updates	Retrieves the updates found during the search. Opnum: 10
Warnings	Retrieves the warnings generated during the search. Opnum: 11

All methods MUST NOT throw exceptions.

3.14.4.1 ISearchResult::resultCode (Opnum 8)

The **ISearchResult::resultCode (opnum 8)** method retrieves the result code for the search.

```
HRESULT ResultCode(
    [out, retval] OperationResultCode* retval
);
```

retval: The [OperationResultCode \(section 2.2.9\)](#) value that specifies the overall result of the search.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **resultCode** ADM element.

3.14.4.2 ISearchResult::RootCategories (Opnum 9)

The **ISearchResult::RootCategories (opnum 9)** method retrieves the root categories found during the search.

```
HRESULT RootCategories(
```

```
[out, retval] ICategoryCollection** retval  
);
```

retval: A collection of the root categories found for the computer.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **RootCategories** ADM element. All root categories of each update returned by the [I SearchResult::Updates \(opnum 10\) \(section 3.14.4.3\)](#) method MUST be contained in the collection returned by the **I SearchResult::RootCategories** method.

3.14.4.3 I SearchResult::Updates (Opnum 10)

The **I SearchResult::Updates (opnum 10)** method retrieves the updates found during the search.

```
HRESULT Updates(  
    [out, retval] IUpdateCollection** retval  
);
```

retval: A collection of the updates found for the computer.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Updates** ADM element. This method MUST return a collection of updates that meet the search criteria specified in the call to the [I UpdateSearcher::Search \(opnum 20\) \(section 3.38.4.11\)](#) method that returned this instance.

3.14.4.4 I SearchResult::Warnings (Opnum 11)

The **I SearchResult::Warnings (opnum 11)** method retrieves the warnings generated during the search.

```
HRESULT Warnings(  
    [out, retval] IUpdateExceptionCollection** retval  
);
```

retval: A collection of the warnings generated during the search.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Warnings** ADM element.

3.16 IUpdateSession, IUpdateSession2, and IUpdateSession3 Server Details

The **IUpdateSession** interface derives from the **IDispatch** interface and represents a session in which callers can perform operations on updates. The **IUpdateSession** interface also exposes read-write properties that are used as parameters for update operations.

The **IUpdateSession2** interface derives from **IUpdateSession**. In addition to the functionality provided by **IUpdateSession**, the **IUpdateSession2** interface adds the ability to control the language in which localized data are provided.

The **IUpdateSession3** interface derives from **IUpdateSession2**. In addition to the functionality provided by **IUpdateSession2**, the **IUpdateSession3** interface provides access to the set of update services registered with the update agent as well as a record of the actions taken by the update agent in the past.

3.16.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The server maintains the following data elements:

- **ClientApplicationID:** A string identifying the client application using the interface. This is mutable.
- **UserLocale:** An [LCID](#) identifying the locale to use when generating localized results for operations performed by interfaces obtained by calling methods defined by this interface. This is mutable.
- **HistoryList:** A list of **IUpdateHistoryEntry** instances representing all history entries recorded by the update agent, sorted by date in descending order. Once initialized, this data element is never modified.

3.16.2 Timers

None.

3.16.3 Initialization

When the server is created, its ADM elements SHOULD be initialized as follows:

- **ClientApplicationID** SHOULD be initialized to the empty string.
- **UserLocale** SHOULD be initialized to an [LCID](#) representing the calling user's default UI language.
- **HistoryList** SHOULD be initialized from persisted history data obtained from the update agent through an implementation-dependent[`<15>`](#) interface.

3.16.4 Message Processing Events and Sequencing Rules for IUpdateSession

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
ClientApplicationID	Retrieves the identifier of the calling application. Opnum: 8
ClientApplicationID	Sets the identifier of the calling application. Opnum: 9
ReadOnly	Returns whether the session is read-only. Opnum: 10
Opnum11NotUsedOnWire	Reserved for local use. Opnum: 11
Opnum 12NotUsedOnWire	Reserved for local use. Opnum: 12
CreateUpdateSearcher	Retrieves an instance of IUpdateSearcher . Opnum: 13
Opnum 13NotUsedOnWire	Reserved for local use. Opnum: 14
Opnum 14NotUsedOnWire	Reserved for local use. Opnum: 15

In the table above, the term "Reserved for local use" means that the client MUST NOT send the opnum, and the server behavior is undefined [§16](#) since it does not affect interoperability.

All methods MUST NOT throw exceptions.

3.16.4.1 IUpdateSession::ClientApplicationID (Opnum 8)

The **IUpdateSession::ClientApplicationID (opnum 8)** method retrieves the identifier of the calling application.

```
HRESULT ClientApplicationID(
    [out, retval] BSTR* retval
);
```

retval: The identifier of the calling application previously set using the [IUpdateSession::ClientApplicationID \(opnum 9\) \(section 3.16.4.2\)](#) method. If no identifier was previously set, this MUST be NULL or the empty string.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ClientApplicationID** ADM element.

3.16.4.2 IUpdateSession::ClientApplicationID (Opnum 9)

The **IUpdateSession::ClientApplicationID (opnum 9)** method sets the identifier of the calling application.

```
HRESULT ClientApplicationID(
    [in] BSTR value
);
```

value: The identifier of the calling application.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD replace the value of the **ClientApplicationID** ADM element with the value of the *value* parameter.

3.16.4.3 IUpdateSession::ReadOnly (Opnum 10)

The **IUpdateSession::ReadOnly (opnum 10)** method returns whether the session is read-only.

```
HRESULT ReadOnly(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be VARIANT_FALSE.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method MUST return VARIANT_FALSE.

3.16.4.4 IUpdateSession::CreateUpdateSearcher (Opnum 13)

The **IUpdateSession::CreateUpdateSearcher (opnum 13)** method retrieves an instance of the **IUpdateSearcher** interface.

```
HRESULT CreateUpdateSearcher(
    [out, retval] IUpdateSearcher** retval
);
```

) ;

retval: An **IUpdateSearcher** instance.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return a newly created object implementing the **IUpdateSearcher** interface.

The returned **IUpdateSearcher** instance SHOULD use the current value of the server's **ClientApplicationID** ADM element as the client application ID for operations that it performs. The **IUpdateSearcher** instance SHOULD use the current value of the server's **UserLocale** ADM element to determine the language in which to generate localized results for operations that it performs.

3.16.5 Message Processing Events and Sequencing Rules for IUpdateSession2

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
UserLocale	Gets the language for update results. Opnum: 14
UserLocale	Sets the language for update results. Opnum: 15

All methods MUST NOT throw exceptions.

3.16.5.1 IUpdateSession2::UserLocale (Opnum 14)

The **IUpdateSession2::UserLocale (opnum 14)** method gets the language for update results.

```
HRESULT UserLocale(
    [out, retval] LCID* retval
);
```

retval: An **LCID** that contains the ID of the locale for results of operations in this session. If no locale is set by using [IUpdateSession2::UserLocale \(opnum 15\) \(section 3.16.5.2\)](#), this MUST contain the current user's default locale as obtained from the system.[<17>](#)

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **UserLocale** ADM element.

3.16.5.2 IUpdateSession2::UserLocale (Opnum 15)

The **IUpdateSession2::UserLocale (opnum 15)** method sets the language for update results.

```
HRESULT UserLocale(
    [in] LCID lcid
);
```

Lcid: An [LCID](#) that contains the language identifier for results of operations in this session.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the **UserLocale** ADM element to the value provided.

3.16.6 Message Processing Events and Sequencing Rules for IUpdateSession3

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
CreateUpdateServiceManager	Retrieves an instance of IUpdateServiceManager2 . Opnum: 16
QueryHistory	Retrieves relevant update history entries. Opnum: 17

All methods MUST NOT throw exceptions.

3.16.6.1 IUpdateSession3::CreateUpdateServiceManager (Opnum 16)

The **IUpdateSession3::CreateUpdateServiceManager (Opnum 16)** method retrieves an instance of the **IUpdateServiceManager2** interface.

```
HRESULT CreateUpdateServiceManager(
    [out, retval] IUpdateServiceManager2** retval
);
```

retval: An **IUpdateServiceManager2** instance.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return a newly created object that implements **IUpdateServiceManager2**.

3.16.6.2 IUpdateSession3::QueryHistory (Opnum 17)

The **IUpdateSession3::QueryHistory (Opnum 17)** method retrieves relevant update history entries.

```
HRESULT QueryHistory(
    [in] BSTR criteria,
    [in] LONG startIndex,
    [in] LONG count,
    [out, retval] IUpdateHistoryEntryCollection** retval
);
```

criteria: A string specifying criteria that select history entries. The string MUST be one of the following:

- NULL or empty, in which case all history entries are selected.
- "UpdateID='<id>'", where <id> is an update identifier. In this case, only history entries pertaining to this update are selected.

startIndex: The zero-based index of the first history entry to retrieve.

count: The number of entries to retrieve.

retval: An **IUpdateHistoryEntryCollection** containing the history entries requested. If fewer entries are available than requested in the count parameter, only the entries available are retrieved.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

This method MUST return an error if the *startIndex* value is less than 0x00000000 or greater than or equal to the number of items in the collection.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method MUST return an **IUpdateHistoryEntryCollection** containing the following history entries, sorted by date in descending order:

- Only history entries pertaining to the update specified in *criteria*, if specified.
- Only history entries starting from the given *startIndex*.
- A maximum of *count* history entries, starting from *startIndex*.

The server SHOULD derive these history entries from the **HistoryList** ADM element.

3.17.4 Message Processing Events and Sequencing Rules

To retrieve an **IUpdateSession** instance, the client MUST do one of the following:

- Directly create an object that implements the **IUpdateSession** interface. The object creation mechanism is implementation-dependent.[<18>](#)
- Obtain an **IUpdateSession2** interface and use the **IUnknown::QueryInterface** method to obtain an **IUpdateSession** interface.
- Obtain an **IUpdateSession3** interface and use the **IUnknown::QueryInterface** method to obtain an **IUpdateSession** interface.

To retrieve an **IUpdateSession2** instance, the client MUST do one of the following:

- Directly create an object that implements the **IUpdateSession2** interface. The object creation mechanism is implementation-dependent.
- Obtain an **IUpdateSession** interface and use the **IUnknown::QueryInterface** method to obtain an **IUpdateSession2** interface.

- Obtain an **IUpdateSession3** interface and use the **IUnknown::QueryInterface** method to obtain an **IUpdateSession2** interface.

To retrieve an **IUpdateSession3** instance, the client MUST do one of the following:

- Directly create an object that implements the **IUpdateSession3** interface. The object creation mechanism is implementation-dependent.
- Obtain an **IUpdateSession** interface and use the **IUnknown::QueryInterface** method to obtain an **IUpdateSession3** interface.
- Obtain an **IUpdateSession2** interface and use the **IUnknown::QueryInterface** method to obtain an **IUpdateSession3** interface.

3.18 IStringCollection Server Details

The **IStringCollection** interface derives from the **IDispatch** interface and represents an ordered list of strings. An **IStringCollection** instance can be read-only or read-write.

3.18.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IStringCollection** server maintains the following data elements:

- **ReadOnly:** A VARIANT_BOOL that indicates whether the collection is read-only. Once initialized, this data element cannot be modified.
- **List:** An ordered list of strings. If the collection is read-only, this data element cannot be changed after initialization. If the collection is read-write, this data element can be modified.
- **Count:** An integer count of the number of elements in the list of strings. If the collection is read-only, this data element cannot be changed after initialization. If the collection is read-write, this data element can be modified.

3.18.2 Timers

None.

3.18.3 Initialization

When the server is created, its ADM is populated with data obtained from the update agent through an implementation-dependent [<19>](#) interface.

3.18.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Item	Gets an item by index. Opnum: 8
Item	Sets an item in the collection. Opnum: 9
NewEnum	Retrieves an enumerator for the collection. Opnum: 10
Count	Retrieves a count of the items in the collection. Opnum: 11
ReadOnly	Retrieves whether the collection is read-only. Opnum: 12
Add	Adds an item to the collection. Opnum: 13
Clear	Removes all items from the collection. Opnum: 14
Copy	Creates a deep read-write copy of the collection. Opnum: 15
Insert	Inserts an item into the collection at a given position. Opnum: 16
RemoveAt	Removes an item from the collection. Opnum: 17

All methods MUST NOT throw exceptions.

3.18.4.1 IStringCollection::Item (Opnum 8)

The **IStringCollection::Item (opnum 8)** method gets an item by index.

```
HRESULT Item(
    [in] LONG index,
    [out, retval] BSTR* retval
);
```

index: The zero-based index of the item to retrieve.

retval: The string at the given index.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the given index is less than 0x00000000 or greater than or equal to the number of items in the collection, the method MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the item at the given index in the **List** ADM element.

3.18.4.2 IStringCollection::Item (Opnum 9)

The **IStringCollection::Item (opnum 9)** method sets an item in the collection.

```
HRESULT Item(
    [in] LONG index,
    [in] BSTR value
);
```

index: The zero-based index of the item to modify.

value: The new item to set in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the index is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

If the collection is read-only, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the item at the given index in the **List** ADM element list to the given value.

3.18.4.3 IStringCollection::_NewEnum (Opnum 10)

The **IStringCollection::_NewEnum** method retrieves an enumerator for the collection.

```
HRESULT _NewEnum(
    [out, retval] IUnknown** retval
);
```

retval: The **IUnknown** interface of an object that also implements the **IEnumVARIANT** interface, which can be used to enumerate the elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD create a new object implementing the **IEnumVARIANT** interface, which enumerates the items in the **List** ADM element.

3.18.4.4 IStringCollection::Count (Opnum 11)

The **IStringCollection::Count (opnum 11)** method retrieves a count of the items in the collection.

```
HRESULT Count(
    [out, retval] LONG* retval
);
```

retval: The number of elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure, defined in [\[MS-ERREF\]](#) section 2.1. The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Count** ADM element.

3.18.4.5 IStringCollection::ReadOnly (Opnum 12)

The **IStringCollection::ReadOnly (opnum 12)** method retrieves whether the collection is read-only.

```
HRESULT ReadOnly(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the collection is read-only or to VARIANT_FALSE if it is not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.

- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ReadOnly** ADM element.

3.18.4.6 IStringCollection::Add (Opnum 13)

The **IStringCollection::Add (opnum 13)** method adds an item to the collection.

```
HRESULT Add(
    [in] BSTR value,
    [out, retval] LONG* retval
);
```

value: The string to add to the collection.

retval: The index of the added string in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the collection is read-only, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD append the given value to the **List** ADM element and increment the value of the **Count** ADM element.

3.18.4.7 IStringCollection::Clear (Opnum 14)

The **IStringCollection::Clear (opnum 14)** method removes all items from the collection.

```
HRESULT Clear();
```

This method has no parameters.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the collection is read-only, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD empty the **List** ADM element and set the value of the **Count** ADM element to 0.

3.18.4.8 IStringCollection::Copy (Opnum 15)

The **IStringCollection::Copy (opnum 15)** method creates a deep read-write copy of the collection from this instance.

```
HRESULT Copy(
    [out, retval] IStringCollection** retval
);
```

retval: A read-write [IStringCollection \(section 3.18.4\)](#) instance containing a copy of the strings in this collection, in the same order.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD create a new object implementing the **IStringCollection** interface and initialize the copy's ADM as follows:

- **ReadOnly:** Set to FALSE.
- **List:** A copy of the original server's **List** ADM element.
- **Count:** Set to the value of the original server's **Count** ADM element.

3.18.4.9 IStringCollection::Insert (Opnum 16)

The **IStringCollection::Insert (opnum 16)** method inserts an item into the collection at a given position.

```
HRESULT Insert(
    [in] LONG index,
    [in] BSTR value
);
```

index: The position at which to insert the string.

value: The string to insert into the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the collection is read-only, the server MUST return an error.

If the index is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error. The server MUST allow insertion at the end of the collection.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD insert the given value into its **List** ADM element at the given index, and increment the value of its **Count** ADM element.

3.18.4.10 IStringCollection::RemoveAt (Opnum 17)

The **IStringCollection::RemoveAt (opnum 17)** method removes an item from the collection.

```
HRESULT RemoveAt(
    [in] LONG index
);
```

index: The index of the string to remove.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the collection is read-only, the server MUST return an error.

If the index is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD remove the item in its **List** ADM element at the given index and decrement the value of its **Count** ADM element.

3.20 IUpdate, IUpdate2, IUpdate3, IUpdate4, IUpdate5, IWindowsDriverUpdate, IWindowsDriverUpdate2, IWindowsDriverUpdate3, IWindowsDriverUpdate4, and IWindowsDriverUpdate5 Server Details

The **IUpdate** interface derives from the **IDispatch** interface and is an immutable representation of an update. This interface defines methods that return read-only properties of an update.

The **IUpdate2** interface derives from the **IUpdate** interface and provides additional read-only data about an update.

The **IUpdate3** interface derives from the **IUpdate2** interface and provides additional read-only data about an update.

The **IUpdate4** interface derives from the **IUpdate3** interface and provides additional read-only data about an update.

The **IUpdate5** interface derives from the **IUpdate4** interface and provides additional read-only data about an update.

The **IWindowsDriverUpdate** interface derives from the **IUpdate** interface and represents a driver.

The **IWindowsDriverUpdate2** interface derives from the **IWindowsDriverUpdate** interface and provides additional read-only data about a driver.

The **IWindowsDriverUpdate3** interface derives from the **IWindowsDriverUpdate2** interface and provides additional read-only data about a driver.

The **IWindowsDriverUpdate4** interface derives from the **IWindowsDriverUpdate3** interface and provides additional read-only data about a driver.

The **IWindowsDriverUpdate5** interface derives from the **IWindowsDriverUpdate4** interface and provides additional read-only data about a driver.

If the update is not a driver, the server MUST return an error when the **IUnknown::QueryInterface** method is called to query for the **IWindowsDriverUpdate** interface, the **IWindowsDriverUpdate2** interface, the **IWindowsDriverUpdate3** interface, the **IWindowsDriverUpdate4** interface, or the **IWindowsDriverUpdate5** interface.

3.20.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The server maintains the following data elements.

Locale: An [LCID](#) identifying the locale for localized data.

Title: A string containing the localized title of the update.

AutoSelectOnWebSites: A VARIANT_BOOL indicating whether the update is recommended to be automatically selected in website UIs.

BundledUpdates: An **IUpdateCollection** instance containing **IUpdate** instances representing the updates that are bundled by this update.

CanRequireSource: A VARIANT_BOOL indicating whether the installation of this update can require source media.

Categories: An **ICategoryCollection** instance containing **ICategory** instances representing the categories to which this update belongs.

HasDeadline: A Boolean indicating whether the administrator has set a deadline before which the update is required to be installed.

Deadline: A DATE ([\[MS-OAUT\]](#) section 2.2.25) set to the date-time, in UTC, before which the update is required to be installed.

DeltaCompressedContentAvailable: A VARIANT_BOOL indicating whether delta-compressed content is available for the update.

DeltaCompressedContentPreferred: A VARIANT_BOOL indicating whether delta-compressed content is preferred for the update.

Description: A string containing the localized description of the update.

HasEula: A Boolean indicating whether the update has an associated software license agreement.

EulaAccepted: A VARIANT_BOOL indicating whether the software license agreement associated with the update has been accepted by the user.

EulaText: A string containing the text of the software license agreement associated with the update.

HandlerID: A string containing a URI that identifies the handler for the update.

Identity: An **IUpdateIdentity** instance that uniquely identifies this update.

Image: An **IImageInformation** instance that represents a localized image associated with the update. This can be NULL if no such image exists.

InstallationBehavior: An **IInstallationBehavior** instance describing the installation behavior of the update.

IsBeta: A VARIANT_BOOL indicating whether this update is a beta release.

IsDownloaded: A VARIANT_BOOL indicating whether the update is currently cached by the update agent.

IsHidden: A VARIANT_BOOL indicating whether the update has been hidden by a user.

IsInstalled: A VARIANT_BOOL indicating whether the update is installed.

IsMandatory: A VARIANT_BOOL indicating whether the installation of the update is mandatory.

IsUninstallable: A VARIANT_BOOL indicating whether the update can be uninstalled.

Languages: An **IStringCollection** instance identifying the set of languages supported by the update. Each language is identified by a separate string containing a language identifier as specified by [\[W3C-XSD\]](#).

LastDeploymentChangeTime: A **DATE** set to the date-time, in UTC, when the update was last published.

MaxDownloadSize: A [DECIMAL \(section 2.2.16\)](#) set to the maximum download size of the update, in bytes.

MinDownloadSize: Retrieves the minimum download size of the update, in bytes.

MoreInfoUrls: An **IStringCollection** instance containing URLs of documents that contain more information about the update.

MsrcSeverity: A string containing a rating of the severity of the problem that the update fixes.

RecommendedCpuSpeed: A **LONG** set to the CPU speed, in megahertz, recommended for the installation of the update or to 0x00000000 if there is no recommended CPU speed.

RecommendedHardDiskSpace: A **LONG** set to the free hard disk space, in megabytes, recommended for the installation of the update or to 0x00000000 if there is no recommended hard disk space.

RecommendedMemory: A **LONG** set to the amount of memory, in megabytes, recommended for the installation of the update or to 0x00000000 if there is no recommended amount of memory.

ReleaseNotes: A string set to the localized release notes for the update.

SecurityBulletinIDs: An **IStringCollection** instance containing the security bulletin IDs associated with the update.

SupersededUpdateIDs: An **IStringCollection** instance containing the IDs of updates that are superseded by the update. Each ID is the string form of a UUID, as specified in [\[RFC4122\]](#) section 3.

SupportUrl: A string containing a URL of a document containing support information for the update.

Type: A value from the [UpdateType \(section 2.2.3\)](#) enumeration indicating the type of the update.

UninstallationNotes: A string containing the localized uninstallation notes for the update.

UninstallationBehavior: An **IInstallationBehavior** instance describing the uninstallation behavior of the update.

UninstallationSteps: An **IStringCollection** instance containing a list of localized uninstallation steps for the update.

KBArticleIDs: An **IStringCollection** instance containing a list of Knowledge Base article IDs associated with the update.

DeploymentAction: A value from the [DeploymentAction \(section 2.2.4\)](#) enumeration indicating the deployment action for the update.

DownloadPriority: A value from the [DownloadPriority \(section 2.2.5\)](#) enumeration indicating the download priority for the update.

DownloadContents: An **IUpdateDownloadContentCollection** instance containing **IUpdateDownloadContent** instances representing download content locations for the update.

RebootRequired: A VARIANT_BOOL indicating whether a reboot is needed to complete installation or uninstallation of the update.

IsPresent: A VARIANT_BOOL indicating whether this update is installed for one or more products.

CveIDs: An **IStringCollection** instance containing the **Common Vulnerabilities and Exposures (CVE) IDs** associated with the update.

BrowseOnly: A VARIANT_BOOL that describes whether the update is considered browse-only.

PerUser: A VARIANT_BOOL that describes whether the update is installed per user rather than per machine.

AutoSelection: A value from the [AutoSelectionMode \(section 2.2.6\)](#) enumeration that describes the conditions under which this update is recommended to be selected in a GUI.

AutoDownload: A value from the [AutoDownloadMode \(section 2.2.7\)](#) enumeration that describes the conditions under which this update is recommended to be automatically downloaded by an update agent.

WindowsDriverUpdateEntries: An **IWindowsDriverUpdateEntryCollection** containing **IWindowsDriverUpdateEntry** instances describing the devices that this driver matches. If the update is not a driver, this SHOULD be NULL.

DefaultWindowsDriverUpdateEntry: An **IWindowsDriverUpdateEntry** instance chosen from the collection of **IWindowsDriverUpdateEntry** instances contained in the **WindowsDriverUpdateEntries** ADM element. If the update is not a driver, this SHOULD be NULL.

Once initialized, these data elements are not modified.

3.20.2 Timers

None.

3.20.3 Initialization

When an instance is created, the instance SHOULD obtain the value of the creating server's **Locale** ADM element through an implementation-dependent [\(20\)](#) interface and store that value in its own **Locale** ADM element. It SHOULD then populate its ADM (with the exception of the **DefaultWindowsDriverUpdateEntry** ADM element) from update metadata obtained from the update agent through an implementation-dependent [\(21\)](#) interface. Localized data SHOULD be retrieved in the locale identified by the **Locale** ADM element.

If the **WindowsDriverUpdateEntries** ADM element is not NULL, the **DefaultWindowsDriverUpdateEntry** SHOULD be initialized as follows:

- If the **WindowsDriverUpdateEntries** ADM element contains exactly one item, the **DefaultWindowsDriverUpdateEntry** SHOULD be initialized to point to that item.
- If the **WindowsDriverUpdateEntries** ADM element contains more than one item, the **DefaultWindowsDriverUpdateEntry** SHOULD be initialized to point to one of those items, as determined in an implementation-dependent [\(22\)](#) manner.

3.20.4 Message Processing Events and Sequencing Rules for IUpdate

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Title	Retrieves the localized title of the update. Opnum: 8
AutoSelectOnWebSites	Retrieves whether the update should be automatically selected in website UIs. Opnum: 9
BundledUpdates	Retrieves a collection of the updates bundled by the update. Opnum: 10
CanRequireSource	Retrieves whether the installation of the update can require source media. Opnum: 11

Method	Description
<u>Categories</u>	Retrieves a collection of the categories to which the update belongs. Opnum: 12
<u>Deadline</u>	Retrieves the date-time before which the update should be installed. Opnum: 13
<u>DeltaCompressedContentAvailable</u>	Retrieves whether delta-compressed content is available for the update. Opnum: 14
<u>DeltaCompressedContentPreferred</u>	Retrieves whether delta-compressed content is preferred for the update. Opnum: 15
<u>Description</u>	Retrieves the localized description for the update. Opnum: 16
<u>EulaAccepted</u>	Retrieves whether the software license terms associated with the update has been accepted by a user. Opnum: 17
<u>EulaText</u>	Retrieves the text of the software license terms associated with the update. Opnum: 18
<u>HandlerID</u>	Retrieves the URI identifying the handler for the update. Opnum: 19
<u>Identity</u>	Retrieves the unique identity of the update. Opnum: 20
<u>Image</u>	Retrieves a localized image associated with the update. Opnum: 21
<u>InstallationBehavior</u>	Retrieves a description of the installation behavior of the update. Opnum: 22
<u>IsBeta</u>	Retrieves whether the update is a beta release. Opnum: 23
<u>IsDownloaded</u>	Retrieves whether the update is currently cached by the update agent. Opnum: 24
<u>IsHidden</u>	Retrieves whether the update has been hidden by a user. Opnum: 25
Opnum26NotUsedOnWire	Reserved for local use. Opnum: 26

Method	Description
<u>IsInstalled</u>	Retrieves whether the update is installed. Opnum: 27
<u>IsMandatory</u>	Retrieves whether the installation of the update is mandatory. Opnum: 28
<u>IsUninstallable</u>	Retrieves whether the update can be uninstalled. Opnum: 29
<u>Languages</u>	Retrieves a collection of languages supported by the update. Opnum: 30
<u>LastDeploymentChangeTime</u>	Retrieves the date-time when the update was last published. Opnum: 31
<u>MaxDownloadSize</u>	Retrieves the maximum download size of the update. Opnum: 32
<u>MinDownloadSize</u>	Retrieves the minimum download size of the update. Opnum: 33
<u>MoreInfoUrls</u>	Retrieves a collection of URLs of documents that contain more information about the update. Opnum: 34
<u>MsrcSeverity</u>	Retrieves a rating of the severity of the problem that the update fixes. Opnum: 35
<u>RecommendedCpuSpeed</u>	Retrieves the CPU speed recommended for the installation of the update. Opnum: 36
<u>RecommendedHardDiskSpace</u>	Retrieves the free hard disk space recommended for the installation of the update. Opnum: 37
<u>RecommendedMemory</u>	Retrieves the amount of memory recommended for the installation of the update. Opnum: 38
<u>ReleaseNotes</u>	Retrieves the localized release notes for the update. Opnum: 39
<u>SecurityBulletinIDs</u>	Retrieves the security bulletin IDs associated with the update. Opnum: 40
<u>SupersededUpdateIDs</u>	Retrieves a collection of the IDs of updates that are superseded by the update. Opnum: 41
<u>SupportUrl</u>	Retrieves a URL for a document containing support information

Method	Description
	for the update. Opnum: 42
Type	Retrieves the type of the update. Opnum: 43
UninstallationNotes	Retrieves the localized uninstallation notes for the update. Opnum: 44
UninstallationBehavior	Retrieves a description of the uninstallation behavior for the update. Opnum: 45
UninstallationSteps	Retrieves a list of localized uninstallation steps for the update. Opnum: 46
KBArticleIDs	Retrieves a list of Knowledge Base article IDs associated with the update. Opnum: 47
Opnum48NotUsedOnWire	Reserved for local use. Opnum: 48
DeploymentAction	Retrieves the deployment action for the update. Opnum: 49
Opnum50NotUsedOnWire	Reserved for local use. Opnum: 50
DownloadPriority	Retrieves the download priority for the update. Opnum: 51
DownloadContents	Retrieves a collection of download content locations for the update. Opnum: 52

In the table above, the term "Reserved for local use" means that the client MUST NOT send the opnum, and the server behavior is undefined[<23>](#) since it does not affect interoperability.

All methods MUST NOT throw exceptions.

3.20.4.1 IUpdate::Title (Opnum 8)

The **IUpdate::Title (opnum 8)** method retrieves the localized title of the update.

```
HRESULT Title(
    [out, retval] BSTR* retval
);
```

retval: The localized title of the update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **Title** ADM element.

3.20.4.2 IUpdate::AutoSelectOnWebSites (Opnum 9)

The **IUpdate::AutoSelectOnWebSites (opnum 9)** method retrieves whether the update is recommended to be selected automatically in website UIs.

```
HRESULT AutoSelectOnWebSites(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be VARIANT_TRUE if the update should be selected in website UIs or VARIANT_FALSE if it should not be selected in UIs.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **AutoSelectOnWebSites** ADM element.

3.20.4.3 IUpdate::BundledUpdates (Opnum 10)

The **IUpdate::BundledUpdates (opnum 10)** method retrieves a collection of the updates bundled by the update.

```
HRESULT BundledUpdates(
    [out, retval] IUpdateCollection** retval
);
```

retval: An **IUpdateCollection** instance containing an ordered list of the updates bundled by this update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **BundledUpdates** ADM element.

3.20.4.4 IUpdate::CanRequireSource (Opnum 11)

The **IUpdate::CanRequireSource (opnum 11)** method retrieves whether the installation of the update can require source media.

```
HRESULT CanRequireSource(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be VARIANT_TRUE if the update can require source media or VARIANT_FALSE if the update never requires source media.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **CanRequireSource** ADM element.

3.20.4.5 IUpdate::Categories (Opnum 12)

The **IUpdate::Categories (opnum 12)** method retrieves a collection of the categories to which the update belongs.

```
HRESULT Categories(
    [out, retval] ICategoryCollection** retval
);
```

retval: An **ICategoryCollection** instance containing the categories to which this update belongs.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **Categories** ADM element.

3.20.4.6 IUpdate::Deadline (Opnum 13)

The **IUpdate::Deadline** (opnum 13) method retrieves the date-time before which the update should be installed.

```
HRESULT Deadline(
    [out, retval] VARIANT* retval
);
```

retval: Specifies the Coordinated Universal Time (UTC) date-time by which the update must be installed or uninstalled, depending upon its deployment action. If there is no deadline for this update, the **vt** field MUST be set to VT_EMPTY. Otherwise, the **vt** member MUST be set to VT_DATE, and the date-time of the deadline MUST be stored in the **date** field.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

If the **HasDeadline** ADM element is set to TRUE, the server SHOULD set the **vt** field of *retval* to VT_DATE and return the value of the **Deadline** ADM element in the **date** field of *retval*.

Otherwise, if the **HasDeadline** ADM element is set to FALSE, the server SHOULD set the **vt** field of *retval* to VT_EMPTY.

3.20.4.7 IUpdate::DeltaCompressedContentAvailable (Opnum 14)

The **IUpdate::DeltaCompressedContentAvailable** (opnum 14) method retrieves whether delta-compressed content is available for the update.

```
HRESULT DeltaCompressedContentAvailable(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if there is delta-compressed content available for this update or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **DeltaCompressedContentAvailable** ADM element.

3.20.4.8 IUpdate::DeltaCompressedContentPreferred (Opnum 15)

The **IUpdate::DeltaCompressedContentPreferred (opnum 15)** method retrieves whether delta-compressed content is preferred for the update.

```
HRESULT DeltaCompressedContentPreferred(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if delta-compressed content is preferred or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **DeltaCompressedContentPreferred** ADM element.

3.20.4.9 IUpdate::Description (Opnum 16)

The **IUpdate::Description (opnum 16)** method retrieves the localized description for the update.

```
HRESULT Description(
    [out, retval] BSTR* retval
);
```

retval: A localized description of the update. If there is no description of the update, this MUST be set to NULL or the empty string.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **Description** ADM element.

3.20.4.10 IUpdate::EulaAccepted (Opnum 17)

The **IUpdate::EulaAccepted (opnum 17)** method retrieves whether the software license terms associated with the update have been accepted by a user.

```
HRESULT EulaAccepted(
    [out, retval] VARIANT_BOOL* retval
);
```

) ;

retval: MUST be set either to VARIANT_TRUE if the software license terms associated with this update have been accepted by a user on the computer or to VARIANT_FALSE if not. If no software license terms are associated with this update, *retval* MUST be set to VARIANT_TRUE.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

If the value of the **HasEula** ADM element is TRUE, the server SHOULD return the value of the **EulaAccepted** ADM element. Otherwise, if the value of the **HasEula** ADM element is FALSE, the server SHOULD return VARIANT_TRUE.

3.20.4.11 IUpdate::EulaText (Opnum 18)

The **IUpdate::EulaText (opnum 18)** method retrieves the text of the software license terms associated with the update.

```
HRESULT EulaText(
    [out, retval] BSTR* retval
);
```

retval: The localized text of the software license terms associated with the update. If no software license terms are associated with the update, *retval* MUST be set to NULL or the empty string.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

If the value of the **HasEula** ADM element is TRUE, the server SHOULD return the value of the **EulaText** ADM element. Otherwise, if the value of the **HasEula** ADM element is FALSE, the server SHOULD return NULL or the empty string.

3.20.4.12 IUpdate::HandlerID (Opnum 19)

The **IUpdate::HandlerID (opnum 19)** method retrieves the URI identifying the handler for the update.

```
HRESULT HandlerID(
    [out, retval] BSTR* retval
);
```

```
);
```

retval: A URI identifying a handler that manages the download, installation, and uninstallation of the update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **HandlerID** ADM element.

3.20.4.13 IUpdate::Identity (Opnum 20)

The **IUpdate::Identity (opnum 20)** method retrieves the unique identity of the update.

```
HRESULT Identity(
    [out, retval] IUpdateIdentity** retval
);
```

retval: An **IUpdateIdentity** instance that uniquely identifies the update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **Identity** ADM element.

3.20.4.14 IUpdate::Image (Opnum 21)

The **IUpdate::Image (opnum 21)** method retrieves a localized image associated with the update.

```
HRESULT Image(
    [out, retval] IIImageInformation** retval
);
```

retval: An **IIImageInformation** instance that contains information about the localized image associated with the update. If no image is associated with the update, *retval* MUST be set to NULL.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **Image** ADM element.

3.20.4.15 IUpdate::InstallationBehavior (Opnum 22)

The **IUpdate::InstallationBehavior (opnum 22)** method retrieves a description of the installation behavior of the update.

```
HRESULT InstallationBehavior(
    [out, retval] IIInstallationBehavior** retval
);
```

retval: An **InstallationBehavior** instance defining the behavior of the installation operation for this update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **InstallationBehavior** ADM element.

3.20.4.16 IUpdate::IsBeta (Opnum 23)

The **IUpdate::IsBeta (opnum 23)** method retrieves whether the update is a beta release.

```
HRESULT IsBeta(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the update is a beta release or to VARIANT_FALSE if it is not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **IsBeta** ADM element.

3.20.4.17 IUpdate::IsDownloaded (Opnum 24)

The **IUpdate::IsDownloaded (opnum 24)** method retrieves whether the update is currently cached by the update agent.

```
HRESULT IsDownloaded(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if all the update content has been cached on the computer or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **IsDownloaded** ADM element.

3.20.4.18 IUpdate::IsHidden (Opnum 25)

The **IUpdate::IsHidden (opnum 25)** method retrieves whether the update has been hidden by a user.

```
HRESULT IsHidden(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the update has been hidden by a user or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **IsHidden** ADM element.

3.20.4.19 IUpdate::IsInstalled (Opnum 27)

The **IUpdate::IsInstalled (opnum 27)** method retrieves whether the update is installed.

```
HRESULT IsInstalled(
    [out, retval] VARIANT_BOOL* retval
);
```

```
);
```

retval: MUST be set either to VARIANT_TRUE if the update was installed when the search that produced this IUpdate instance was performed or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **IsInstalled** ADM element.

3.20.4.20 IUpdate::IsMandatory (Opnum 28)

The **IUpdate::IsMandatory (opnum 28)** method retrieves whether the installation of the update is mandatory.

```
HRESULT IsMandatory(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the installation of the update is mandatory or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **IsMandatory** ADM element.

3.20.4.21 IUpdate::IsUninstallable (Opnum 29)

The **IUpdate::IsUninstallable (opnum 29)** method retrieves whether the update can be uninstalled.

```
HRESULT IsUninstallable(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the update can be uninstalled or to VARIANT_FALSE otherwise.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **IsUninstallable** ADM element.

3.20.4.22 IUpdate::Languages (Opnum 30)

The **IUpdate::Languages (opnum 30)** method retrieves a collection of languages supported by the update.

```
HRESULT Languages(
    [out, retval] IStringCollection** retval
);
```

retval: An **IStringCollection** instance containing the languages supported by this update. Languages are identified using identifiers specified by [\[W3C-XSD\]](#).

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **Languages** ADM element.

3.20.4.23 IUpdate::LastDeploymentChangeTime (Opnum 31)

The **IUpdate::LastDeploymentChangeTime (opnum 31)** method retrieves the date-time when the update was last published.

```
HRESULT LastDeploymentChangeTime(
    [out, retval] DATE* retval
);
```

retval: The date-time, in UTC, when the update was last published on the server.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **LastDeploymentChangeTime** ADM element.

3.20.4.24 IUpdate::MaxDownloadSize (Opnum 32)

The **IUpdate::MaxDownloadSize (opnum 32)** method retrieves the maximum download size of the update.

```
HRESULT MaxDownloadSize(
    [out, retval] DECIMAL* retval
);
```

retval: The maximum number of bytes that might need to be downloaded for the update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **MaxDownloadSize** ADM element.

3.20.4.25 IUpdate::MinDownloadSize (Opnum 33)

The **IUpdate::MinDownloadSize (opnum 33)** method retrieves the minimum download size of the update.

```
HRESULT MinDownloadSize(
    [out, retval] DECIMAL* retval
);
```

retval: The minimum number of bytes that might need to be downloaded for this update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **MinDownloadSize** ADM element.

3.20.4.26 IUpdate::MoreInfoUrls (Opnum 34)

The **IUpdate::MoreInfoUrls (opnum 34)** method retrieves a collection of URLs of documents that contain more information about the update.

```
HRESULT MoreInfoUrls(
    [out, retval] IStringCollection** retval
);
```

retval: An **IStringCollection** instance containing URLs of documents that contain additional, localized information about the update. If there is no additional information for the update, the **IStringCollection** instance MUST be empty.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **MoreInfoUrls** ADM element.

3.20.4.27 IUpdate::MsrcSeverity (Opnum 35)

The **IUpdate::MsrcSeverity (opnum 35)** method retrieves a rating of the severity of the problem that the update fixes.

```
HRESULT MsrcSeverity(
    [out, retval] BSTR* retval
);
```

retval: A string indicating the severity of the issue fixed by this update as defined by the Microsoft Security Response Center (MSRC). The string SHOULD be set to an enumerated list of values. [<24>](#)

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **MsrcSeverity** ADM element.

3.20.4.28 IUpdate::RecommendedCpuSpeed (Opnum 36)

The **IUpdate::RecommendedCpuSpeed (opnum 36)** method retrieves the CPU speed recommended for the installation of the update.

```
HRESULT RecommendedCpuSpeed(
    [out, retval] LONG* retval
);
```

retval: The recommended CPU speed, in megahertz, for installation of the update. If there is no recommended CPU speed for the update, *retval* MUST be set to 0x00000000.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **RecommendedCpuSpeed** ADM element.

3.20.4.29 IUpdate::RecommendedHardDiskSpace (Opnum 37)

The **IUpdate::RecommendedHardDiskSpace (opnum 37)** method retrieves the free hard disk space recommended for the installation of the update.

```
HRESULT RecommendedHardDiskSpace(
    [out, retval] LONG* retval
);
```

retval: The recommended free disk space, in megabytes, for installation of the update. If there is no recommended hard disk space for this update, *retval* MUST be set to 0x00000000.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **RecommendedHardDiskSpace** ADM element.

3.20.4.30 IUpdate::RecommendedMemory (Opnum 38)

The **IUpdate::RecommendedMemory (opnum 38)** method retrieves the amount of memory recommended for the installation of the update.

```
HRESULT RecommendedMemory(
    [out, retval] LONG* retval
);
```

retval: The recommended amount of physical memory, in megabytes, for installation of the update. If there is no recommended amount of physical memory for this update, *retval* MUST be set to 0x00000000.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **RecommendedMemory** ADM element.

3.20.4.31 IUpdate::ReleaseNotes (Opnum 39)

The **IUpdate::ReleaseNotes (opnum 39)** method retrieves the localized release notes for the update.

```
HRESULT ReleaseNotes(
    [out, retval] BSTR* retval
);
```

retval: The localized release notes for this update. If there are no release notes, *retval* MUST be set either to NULL or to the empty string.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **ReleaseNotes** ADM element.

3.20.4.32 IUpdate::SecurityBulletinIDs (Opnum 40)

The **IUpdate::SecurityBulletinIDs (opnum 40)** method retrieves the security bulletin IDs associated with the update.

```
HRESULT SecurityBulletinIDs(
    [out, retval] IStringCollection** retval
);
```

retval: An **IStringCollection** instance containing the security bulletin IDs associated with this update. If no security bulletin IDs are associated with this update, *retval* MUST be set to an empty **IStringCollection** instance.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **SecurityBulletinIDs** ADM element.

3.20.4.33 IUpdate::SupersededUpdateIDs (Opnum 41)

The **IUpdate::SupersededUpdateIDs (opnum 41)** method retrieves a collection of the IDs of updates that are superseded by the update.

```
HRESULT SupersededUpdateIDs(
    [out, retval] IStringCollection** retval
);
```

retval: An **IStringCollection** instance containing the IDs of the updates superseded by the update. If this update does not supersede any updates, *retval* MUST be set to an empty **IStringCollection** instance.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **SupersededUpdateIDs** ADM element.

3.20.4.34 IUpdate::SupportUrl (Opnum 42)

The **IUpdate::SupportUrl (opnum 42)** method retrieves a URL for a document containing support information for the update.

```
HRESULT SupportUrl(
    [out, retval] BSTR* retval
);
```

retval: A URL for a document containing localized support information for the update. If there is no support information for this update, *retval* MUST be set either to NULL or to the empty string.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **SupportUrl** ADM element.

3.20.4.35 IUpdate::Type (Opnum 43)

The **IUpdate::Type (opnum 43)** method retrieves the type of the update.

```
HRESULT Type(
    [out, retval] UpdateType* retval
);
```

retval: A value of the [UpdateType \(section 2.2.3\)](#) enumeration that describes the type of the update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **Type** ADM element.

3.20.4.36 IUpdate::UninstallationNotes (Opnum 44)

The **IUpdate::UninstallationNotes (opnum 44)** method retrieves the localized uninstallation notes for the update.

```
HRESULT UninstallationNotes(
    [out, retval] BSTR* retval
);
```

retval: The uninstallation notes for this update. If there are no uninstallation notes, *retval* MUST be set either to NULL or to the empty string.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **UninstallationNotes** ADM element.

3.20.4.37 IUpdate::UninstallationBehavior (Opnum 45)

The **IUpdate::UninstallationBehavior (opnum 45)** method retrieves a description of the uninstallation behavior for the update.

```
HRESULT UninstallationBehavior(
    [out, retval] IIInstallationBehavior** retval
);
```

retval: An **IIInstallationBehavior** instance describing the behavior of the uninstallation operation for this update. If the update cannot be uninstalled, *retval* MUST be set to NULL.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **UninstallationBehavior** ADM element.

3.20.4.38 IUpdate::UninstallationSteps (Opnum 46)

The **IUpdate::UninstallationSteps (opnum 46)** method retrieves a list of localized uninstallation steps for the update.

```
HRESULT UninstallationSteps(
    [out, retval] IStringCollection** retval
);
```

retval: An **IStringCollection** interface containing localized strings that specify the uninstallation steps for the update. If there are no uninstallation steps for the update, *retval* MUST be set to an empty **IStringCollection**.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **UninstallationSteps** ADM element.

3.20.4.39 IUpdate::KBArticleIDs (Opnum 47)

The **IUpdate::KBArticleIDs (opnum 47)** method retrieves a list of Knowledge Base article IDs associated with the update.

```
HRESULT KBArticleIDs(
    [out, retval] IStringCollection** retval
);
```

retval: An **IStringCollection** interface containing the IDs of Knowledge Base articles for the update. If there are no Knowledge Base articles for the update, *retval* MUST be set to an empty **IStringCollection**.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.

- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [[MS-RPCE](#)].

The server SHOULD return the value of the **KBArticleIDs** ADM element.

3.20.4.40 IUpdate::DeploymentAction (Opnum 49)

The **IUpdate::DeploymentAction (opnum 49)** method retrieves the deployment action for the update.

```
HRESULT DeploymentAction(
    [out, retval] DeploymentAction* retval
);
```

retval: A [DeploymentAction \(section 2.2.4\)](#) enumeration value that indicates the action for which the update is deployed.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [[MS-RPCE](#)].

The server SHOULD return the value of the **DeploymentAction** ADM element.

3.20.4.41 IUpdate::DownloadPriority (Opnum 51)

The **IUpdate::DownloadPriority (opnum 51)** method retrieves the download priority for the update.

```
HRESULT DownloadPriority(
    [out, retval] DownloadPriority* retval
);
```

retval: A [DownloadPriority \(section 2.2.5\)](#) enumeration value that indicates the recommended download priority for the update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [[MS-RPCE](#)].

The server SHOULD return the value of the **DownloadPriority** ADM element.

3.20.4.42 IUpdate::DownloadContents (Opnum 52)

The **IUpdate::DownloadContents (opnum 52)** method retrieves a collection of download content URLs for the update.

```
HRESULT DownloadContents(
    [out, retval] IUpdateDownloadContentCollection** retval
);
```

retval: An [IUpdateDownloadContentCollection \(section 3.26.4\)](#) containing the URLs of downloadable content associated with the update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the value of the **DownloadContents** ADM element.

3.20.5 Message Processing Events and Sequencing Rules for IUpdate2

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
RebootRequired	Retrieves whether a reboot is needed to complete installation or uninstallation of the update. Opnum: 53
IsPresent	Retrieves whether this update is installed for one or more products. Opnum: 54
CveIDs	Retrieves the CVE IDs associated with the update. Opnum: 55
Opnum56NotUsedOnWire	Reserved for local use. Opnum: 56

In the table above, the term "Reserved for local use" means that the client MUST NOT send the opnum, and the server behavior is undefined [<25>](#) since it does not affect interoperability.

All methods MUST NOT throw exceptions.

3.20.5.1 IUpdate2::RebootRequired (Opnum 53)

The **IUpdate2::RebootRequired (opnum 53)** method retrieves whether a reboot is needed to complete installation or uninstallation of the update.

```
HRESULT RebootRequired(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if a reboot is required to complete the installation or uninstallation of this update or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **RebootRequired** ADM element.

3.20.5.2 IUpdate2::IsPresent (Opnum 54)

The **IUpdate2::IsPresent (opnum 54)** method retrieves whether the update is installed for one or more products.

```
HRESULT IsPresent(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the update is installed for one or more products or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IsPresent** ADM element.

3.20.5.3 IUpdate2::CveIDs (Opnum 55)

The **IUpdate2::CveIDs (opnum 55)** method retrieves the CVE IDs associated with the update.

```
HRESULT CveIDs(
    [out, retval] IStringCollection** retval
);
```

) ;

retval: An **IStringCollection** instance containing the CVE IDs associated with the update. If no CVE IDs are associated with the update, *retval* MUST be set to an empty **IStringCollection**.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **CveIDs** ADM element.

3.20.6 Message Processing Events and Sequencing Rules for IUpdate3

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
BrowseOnly	Retrieves whether the update is browse-only. Opnum: 57

All methods MUST NOT throw exceptions.

3.20.6.1 IUpdate3::BrowseOnly (Opnum 57)

The **IUpdate3::BrowseOnly (opnum 57)** method retrieves whether the update is browse-only.

```
HRESULT BrowseOnly(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if this update is not recommended to be installed automatically or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **BrowseOnly** ADM element.

3.20.7 Message Processing Events and Sequencing Rules for IUpdate4

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
PerUser	Retrieves whether the update is per user. Opnum: 58

All methods MUST NOT throw exceptions.

3.20.7.1 IUpdate4::PerUser (Opnum 58)

The **IUpdate4::PerUser (opnum 58)** method retrieves whether the update is per user.

```
HRESULT PerUser(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if this update is installed per user rather than per machine or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **PerUser** ADM element.

3.20.8 Message Processing Events and Sequencing Rules for IUpdate5

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
AutoSelection	Retrieves a value describing the recommendation for whether the update should be selected automatically in a user interface.

Method	Description
	Opnum: 59
AutoDownload	Retrieves a value describing the recommendation for whether the update should be downloaded automatically. Opnum: 60

All methods MUST NOT throw exceptions.

3.20.8.1 IUpdate5::AutoSelection (Opnum 59)

The **IUpdate5::AutoSelection (opnum 59)** method retrieves a value describing when the update is recommended to be selected automatically in a user interface.

```
HRESULT AutoSelection(
    [out, retval] AutoSelectionMode* retval
);
```

retval: An [AutoSelectionMode \(section 2.2.6\)](#) enumeration value that specifies the recommendation for whether the update should be selected automatically in a user interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **AutoSelection** ADM element.

3.20.8.2 IUpdate5::AutoDownload (Opnum 60)

The **IUpdate5::AutoDownload (opnum 60)** method retrieves a value describing when the update is recommended to be downloaded automatically.

```
HRESULT AutoDownload(
    [out, retval] AutoDownloadMode* retval
);
```

retval: An [AutoDownloadMode \(section 2.2.7\)](#) enumeration value that specifies the recommendation for whether the update should be downloaded automatically.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **AutoDownload** ADM element.

3.20.9 Message Processing Events and Sequencing Rules for IWindowsDriverUpdate

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
DriverClass	Retrieves the class of this driver. Opnum: 53
DriverHardwareID	Retrieves the hardware ID or compatible ID that this driver must match to be installable. Opnum: 54
DriverManufacturer	Retrieves the language-invariant name of the driver manufacturer. Opnum: 55
DriverModel	Retrieves the language-invariant model name of the device for which this driver is intended. Opnum: 56
DriverProvider	Retrieves the language-invariant name of the provider of this driver. Opnum: 57
DriverVerDate	Retrieves the version date of this driver. Opnum: 58
DeviceProblemNumber	Retrieves the problem number of the device that this driver matches. Opnum: 59
DeviceStatus	Retrieves the status of the device that this driver matches. Opnum: 60

All methods MUST NOT throw exceptions.

3.20.9.1 IWindowsDriverUpdate::DriverClass (Opnum 53)

The **IWindowsDriverUpdate::DriverClass (opnum 53)** method retrieves the class of this driver.

```
HRESULT DriverClass(
    [out, retval] BSTR* retval
);
```

retval: A string specifying the class of this driver.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the string returned by a call to the **DriverClass** method on the **IWindowsDriverUpdateEntry** instance referred to by the **DefaultWindowsDriverUpdateEntry** ADM element.

3.20.9.2 IWindowsDriverUpdate::DriverHardwareID (Opnum 54)

The **IWindowsDriverUpdate::DriverHardwareID (opnum 54)** method retrieves the hardware ID or compatible ID that this driver must match to be installable.

```
HRESULT DriverHardwareID(
    [out, retval] BSTR* retval
);
```

retval: A string specifying the hardware ID or compatible ID that this driver must match to be installable.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the string returned by a call to the **DriverHardwareID** method on the **IWindowsDriverUpdateEntry** instance referred to by the **DefaultWindowsDriverUpdateEntry** ADM element.

3.20.9.3 IWindowsDriverUpdate::DriverManufacturer (Opnum 55)

The **IWindowsDriverUpdate::DriverManufacturer (opnum 55)** method retrieves the language-invariant name of the driver manufacturer.

```
HRESULT DriverManufacturer(
    [out, retval] BSTR* retval
);
```

retval: A string containing the language-invariant name of the driver manufacturer.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the string returned by a call to the **DriverManufacturer** method on the **IWindowsDriverUpdateEntry** instance referred to by the **DefaultWindowsDriverUpdateEntry** ADM element.

3.20.9.4 IWindowsDriverUpdate::DriverModel (Opnum 56)

The **IWindowsDriverUpdate::DriverModel (opnum 56)** method retrieves the language-invariant model name of the device for which this driver is intended.

```
HRESULT DriverModel(
    [out, retval] BSTR* retval
);
```

retval: A string containing the language-invariant model name of the device for which this driver is intended.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the string returned by a call to the **DriverModel** method on the **IWindowsDriverUpdateEntry** instance referred to by the **DefaultWindowsDriverUpdateEntry** ADM element.

3.20.9.5 IWindowsDriverUpdate::DriverProvider (Opnum 57)

The **IWindowsDriverUpdate::DriverProvider (opnum 57)** method retrieves the language-invariant name of the provider of this driver.

```
HRESULT DriverProvider(
    [out, retval] BSTR* retval
);
```

retval: A string containing the language-invariant name of the provider of this driver.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the string returned by a call to the **DriverProvider** method on the **IWindowsDriverUpdateEntry** instance referred to by the **DefaultWindowsDriverUpdateEntry** ADM element.

3.20.9.6 IWindowsDriverUpdate::DriverVerDate (Opnum 58)

The **IWindowsDriverUpdate::DriverVerDate (opnum 58)** method retrieves the version date of the driver.

```
HRESULT DriverVerDate(
    [out, retval] DATE* retval
);
```

retval: A **DATE** ([\[MS-OAUT\]](#) section 2.2.25) structure containing the version date of this driver.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value returned by a call to the **DriverVerDate** method on the **IWindowsDriverUpdateEntry** instance referred to by the **DefaultWindowsDriverUpdateEntry** ADM element.

3.20.9.7 IWindowsDriverUpdate::DeviceProblemNumber (Opnum 59)

The **IWindowsDriverUpdate::DeviceProblemNumber (opnum 59)** method retrieves the problem number of the device this driver matches.

```
HRESULT DeviceProblemNumber(
    [out, retval] LONG* retval
);
```

retval: A **LONG** specifying the problem number of the device this driver matches.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value returned by a call to the **DeviceProblemNumber** method on the **IWindowsDriverUpdateEntry** instance referred to by the **DefaultWindowsDriverUpdateEntry** ADM element.

3.20.9.8 IWindowsDriverUpdate::DeviceStatus (Opnum 60)

The **IWindowsDriverUpdate::DeviceStatus (opnum 60)** method retrieves the status of the device this driver matches.

```
HRESULT DeviceStatus(
    [out, retval] LONG* retval
);
```

retval: A [LONG](#) specifying the status of the device this driver matches.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value returned by a call to the **DeviceStatus** method on the **IWindowsDriverUpdateEntry** instance referred to by the **DefaultWindowsDriverUpdateEntry** ADM element.

3.20.10 Message Processing Events and Sequencing Rules for IWindowsDriverUpdate2

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
RebootRequired	Retrieves whether a reboot is needed to complete installation or uninstallation of the update. Opnum: 61
IsPresent	Retrieves whether this update is installed for one or more products. Opnum: 62
CveIDs	Retrieves the CVE IDs associated with the update. Opnum: 63
Opnum64NotUsedOnWire	Reserved for local use. Opnum: 64

In the table above, the term "Reserved for local use" means that the client MUST NOT send the opnum, and the server behavior is undefined [<26>](#) since it does not affect interoperability.

All methods MUST NOT throw exceptions.

3.20.10.1 IWindowsDriverUpdate2::RebootRequired (Opnum 61)

The **IWindowsDriverUpdate2::RebootRequired** (opnum 61) method retrieves whether a reboot is needed to complete installation or uninstallation of the update.

```
HRESULT RebootRequired(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if a reboot is required to complete the installation or uninstallation of this update or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **RebootRequired** ADM element.

3.20.10.2 IWindowsDriverUpdate2::IsPresent (Opnum 62)

The **IWindowsDriverUpdate2::IsPresent** (opnum 62) method retrieves whether the update is installed for one or more products.

```
HRESULT IsPresent(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the update is installed for one or more products or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IsPresent** ADM element.

3.20.10.3 IWindowsDriverUpdate2::CveIDs (Opnum 63)

The **IWindowsDriverUpdate2::CveIDs** (opnum 63) method retrieves the CVE IDs associated with the update.

```
HRESULT CveIDs(
    [out, retval] IStringCollection** retval
);
```

) ;

retval: An [IStringCollection \(section 3.18.4\)](#) instance containing the CVE IDs associated with the update. If no CVE IDs are associated with the update, *retval* MUST be set to an empty [IStringCollection](#).

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **CveIDs** ADM element.

3.20.11 Message Processing Events and Sequencing Rules for IWindowsDriverUpdate3

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
BrowseOnly	Retrieves whether the update is browse-only. Opnum: 65

All methods MUST NOT throw exceptions.

3.20.11.1 IWindowsDriverUpdate3::BrowseOnly (Opnum 65)

The **IWindowsDriverUpdate3::BrowseOnly (opnum 65)** method retrieves whether the update is browse-only. If an update is browse-only, then it is not recommended for the update to be installed automatically.

```
HRESULT BrowseOnly(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if this update is browse-only, or to VARIANT_FALSE otherwise.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **BrowseOnly** ADM element.

3.20.12 Message Processing Events and Sequencing Rules for IWindowsDriverUpdate4

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
WindowsDriverUpdateEntries	Retrieves a collection of driver update entries associated with this driver. Opnum: 66
PerUser	Retrieves whether the update is per user. Opnum: 67

All methods MUST NOT throw exceptions.

3.20.12.1 IWindowsDriverUpdate4::WindowsDriverUpdateEntries (Opnum 66)

The **IWindowsDriverUpdate4::WindowsDriverUpdateEntries (opnum 66)** method retrieves a collection of driver update entries associated with this driver.

```
HRESULT WindowsDriverUpdateEntries(
    [out, retval] IWindowsDriverUpdateEntryCollection** retval
);
```

retval: An **IWindowsDriverUpdateEntryCollection** instance containing **IWindowsDriverUpdateEntry** instances for each device for which this driver can be installed.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **WindowsDriverUpdateEntries** ADM element.

3.20.12.2 IWindowsDriverUpdate4::PerUser (Opnum 67)

The **IWindowsDriverUpdate4::PerUser (opnum 67)** method retrieves whether the update is per user.

```

HRESULT PerUser(
    [out, retval] VARIANT_BOOL* retval
);

```

retval: MUST be set either to VARIANT_TRUE if this update is installed per user rather than per machine or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **PerUser** ADM element.

3.20.13 Message Processing Events and Sequencing Rules for IWindowsDriverUpdate5

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
AutoSelection	Retrieves a value describing the recommendation for whether the update should be selected automatically in a user interface. Opnum: 68
AutoDownload	Retrieves a value describing the recommendation for whether the update should be downloaded automatically. Opnum: 69

All methods MUST NOT throw exceptions.

3.20.13.1 IWindowsDriverUpdate5::AutoSelection (Opnum 68)

The **IWindowsDriverUpdate5::AutoSelection (opnum 68)** method retrieves a value describing when the update is recommended to be selected automatically in the UI.

```

HRESULT AutoSelection(
    [out, retval] AutoSelectionMode* retval
);

```

retval: An [AutoSelectionMode \(section 2.2.6\)](#) enumeration value that specifies the recommendation for whether the update should be selected automatically in a user interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **AutoSelection** ADM element.

3.20.13.2 IWindowsDriverUpdate5::AutoDownload (Opnum 69)

The **IWindowsDriverUpdate5::AutoDownload (opnum 69)** method retrieves a value describing when the update is recommended to be downloaded automatically.

```
HRESULT AutoDownload(
    [out, retval] AutoDownloadMode* retval
);
```

retval: An [AutoDownloadMode \(section 2.2.7\)](#) enumeration value that specifies the recommendation for whether the update should be downloaded automatically.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **AutoDownload** ADM element.

3.20.14 Timer Events

None.

3.20.15 Other Local Events

None.

3.21 IUpdate, IUpdate2, IUpdate3, IUpdate4, IUpdate5, IWindowsDriverUpdate, IWindowsDriverUpdate2, IWindowsDriverUpdate3, IWindowsDriverUpdate4, and IWindowsDriverUpdate5 Client Details

3.21.1 Abstract Data Model

None.

3.21.2 Timers

None.

3.21.3 Initialization

None.

3.21.4 Message Processing Events and Sequencing Rules

An **IUpdate** instance can be retrieved by calling the [**IUpdateCollection::Item \(opnum 8\) \(section 3.22.4.1\)**](#) method.

The client can use the **IUnknown::QueryInterface** method to then obtain an **IUpdate2**, **IUpdate3**, **IUpdate4**, or **IUpdate5** interface. Additionally, if the update is a driver, the client can use the **IUnknown::QueryInterface** method to obtain an **IWindowsDriverUpdate**, **IWindowsDriverUpdate2**, **IWindowsDriverUpdate3**, **IWindowsDriverUpdate4**, or **IWindowsDriverUpdate5** interface.

3.21.5 Timer Events

None.

3.21.6 Other Local Events

None.

3.22 IUpdateCollection Server Details

The **IUpdateCollection** interface derives from the **IDispatch** interface and represents a mutable list of updates.

3.22.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateCollection** server maintains the following data elements:

- **Locale:** An [**LCID**](#) identifying the locale for localized data.
- **ReadOnly:** A VARIANT_BOOL that indicates whether the list is read-only. Once initialized, this data element is not modified.
- **List:** An ordered list of **IUpdate** instances. This data element can be modified only if the collection is not read-only.
- **Count:** An integer count of the items in the list. This element can be modified only if the collection is not read-only.

3.22.2 Timers

None.

3.22.3 Initialization

The server SHOULD obtain the value of the creating server's **Locale** ADM element through an implementation-dependent<27> interface and store it in its own **Locale** ADM element. It SHOULD populate its remaining ADM elements from data obtained from the update agent through an implementation-dependent<28> interface.

3.22.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [MS-RPCE] Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Item	Retrieves an item from the collection by index. Opnum: 8
Item	Replaces an item in the collection by index. Opnum: 9
NewEnum	Returns an enumerator over the collection. Opnum: 10
Count	Returns the number of items in the collection. Opnum: 11
ReadOnly	Returns whether the collection is read-only. Opnum: 12
Add	Adds an item to the collection. Opnum: 13
Clear	Empties the collection. Opnum: 14
Opnum15NotUsedOnWire	Reserved for local use. Opnum: 15
Insert	Inserts an item into the collection. Opnum: 16
RemoveAt	Removes an item from the collection. Opnum: 17

In the table above, the term "Reserved for local use" means that the client MUST NOT send the opnum, and the server behavior is undefined<29> since it does not affect interoperability.

All methods MUST NOT throw exceptions.

3.22.4.1 IUpdateCollection::Item (Opnum 8)

The **IUpdateCollection::Item (opnum 8)** method retrieves an item from the collection by index.

```
HRESULT Item(
    [in] LONG index,
    [out, retval] IUpdate** retval
);
```

index: The zero-based index of the item to retrieve.

retval: The item at the given index.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the index is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the item at the given index in the **List** ADM element.

3.22.4.2 IUpdateCollection::Item (Opnum 9)

The **IUpdateCollection::Item (opnum 9)** method replaces an item in the collection by index.

```
HRESULT Item(
    [in] LONG index,
    [in] IUpdate* value
);
```

index: The zero-based index of the item to replace.

value: The item with which to replace the existing item.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the *index* is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

If the collection is read-only, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the given item at the given *index* in the **List** ADM element.

3.22.4.3 IUpdateCollection::NewEnum (Opnum 10)

The **IUpdateCollection::NewEnum (opnum 10)** method returns an enumerator over the collection.

```
HRESULT _NewEnum(
    [out, retval] IUnknown** retval
);
```

retval: The **IUnknown** interface of an object that also implements the **IEnumVARIANT** interface, which can be used to enumerate the elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD create a new object that implements the **IEnumVARIANT** interface and enumerates over the **List** ADM element.

3.22.4.4 IUpdateCollection::Count (Opnum 11)

The **IUpdateCollection::Count (opnum 11)** method returns the number of items in the collection.

```
HRESULT Count(
    [out, retval] LONG* retval
);
```

retval: The number of items in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Count** ADM element.

3.22.4.5 IUpdateCollection::ReadOnly (Opnum 12)

The **IUpdateCollection::ReadOnly (opnum 12)** method returns whether the collection is read-only.

```
HRESULT ReadOnly(
```

```
[out, retval] VARIANT_BOOL* retval  
);
```

retval: MUST be set either to VARIANT_TRUE if the collection is read-only, or to VARIANT_FALSE if it is not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ReadOnly** ADM element.

3.22.4.6 IUpdateCollection::Add (Opnum 13)

The **IUpdateCollection::Add (opnum 13)** method adds an item to the collection.

```
HRESULT Add(  
    [in] IUpdate* value,  
    [out, retval] LONG* retval  
);
```

value: The item to add to the collection.

retval: The index of the added item.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the collection is read-only, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD append the given item to the **List** ADM element and increment the value of the **Count** ADM element.

3.22.4.7 IUpdateCollection::Clear (Opnum 14)

The **IUpdateCollection::Clear (opnum 14)** method empties the collection.

```
HRESULT Clear();
```

This method has no parameters.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
 - If the severity bit is set to 1, the method failed and encountered a fatal error.
- If the collection is read-only, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD clear the **List** ADM element and set the value of the **Count** ADM element to 0.

3.22.4.8 IUpdateCollection::Insert (Opnum 16)

The **IUpdateCollection::Insert (opnum 16)** method inserts an item into the collection.

```
HRESULT Insert(
    [in] LONG index,
    [in] IUpdate* value
);
```

index: The zero-based position at which to insert the item. This can be a position at the end of the list.

value: The item to insert into the list.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
 - If the severity bit is set to 1, the method failed and encountered a fatal error.
- If the collection is read-only, the server MUST return an error.

If **index** is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD insert the given item at the given index in the **List** ADM element and increment the value of the **Count** ADM element.

3.22.4.9 IUpdateCollection::RemoveAt (Opnum 17)

The **IUpdateCollection::RemoveAt (opnum 17)** method removes an item from the collection.

```
HRESULT RemoveAt(
    [in] LONG index
);
```

index: The zero-based index of the item to remove.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the index is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD remove the item at the given index from the **List** ADM element, and decrement the value of the **Count** ADM element.

3.22.5 Timer Events

3.24 IUpdateDownloadContent and IUpdateDownloadContent2 Server Details

The **IUpdateDownloadContent** interface derives from the **IDispatch** interface and represents the location of a single piece of downloadable content associated with an update.

The **IUpdateDownloadContent2** interface derives from the **IUpdateDownloadContent** interface and defines a method that provides additional information about a piece of downloadable content.

3.24.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateDownloadContent** server maintains the following data element:

- **DownloadUrl:** A string containing a URL specifying the location of the content.
- **IsDeltaCompressedContent:** A VARIANT_BOOL that indicates whether the content is delta-compressed.

Once initialized, this data element is not modified.

3.24.2 Timers

None.

3.24.3 Initialization

When the server is initialized, it SHOULD populate its ADM from update metadata obtained from the update agent through an implementation-dependent [⟨30⟩](#) interface.

3.24.4 Message Processing Events and Sequencing Rules for IUpdateDownloadContent

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
DownloadUrl	Retrieves the location of the content. Opnum: 8

All methods MUST NOT throw exceptions.

3.24.4.1 IUpdateDownloadContent::DownloadUrl (Opnum 8)

The **IUpdateDownloadContent::DownloadUrl (opnum 8)** method retrieves the location of the content.

```

HRESULT DownloadUrl(
    [out, retval] BSTR* retval
);

```

retval: A URL specifying the location of the download content.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **DownloadUrl** ADM element.

3.24.5 Message Processing Events and Sequencing Rules for IUpdateDownloadContent2

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
IsDeltaCompressedContent	Retrieves whether the content is delta-compressed. Opnum: 9

All methods MUST NOT throw exceptions.

3.24.5.1 IUpdateDownloadContent2::IsDeltaCompressedContent (Opnum 9)

The **IUpdateDownloadContent2::IsDeltaCompressedContent (opnum 9)** method retrieves whether the content is delta-compressed.

```

HRESULT IsDeltaCompressedContent(
    [out, retval] VARIANT _BOOL* retval
);

```

retval: MUST be VARIANT_TRUE if the content is delta-compressed or VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IsDeltaCompressedContent** ADM element.

3.25.4 Message Processing Events and Sequencing Rules

To retrieve an **IUpdateDownloadContent** instance, a client MUST call [IUpdateDownloadContentCollection::Item \(opnum 8\) \(section 3.26.4.1\)](#).

To retrieve an **IUpdateDownloadContent2** instance, a client MUST retrieve an **IUpdateDownloadContent** instance, and then use the **IUnknown::QueryInterface** method to obtain an **IUpdateDownloadContent2** instance.

3.25.5 Timer Events

None.

3.25.6 Other Local Events

None.

3.26 IUpdateDownloadContentCollection Server Details

The **IUpdateDownloadContentCollection** interface derives from the **IDispatch** interface and represents an immutable list of download content.

3.26.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations

adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateDownloadContentCollection** server maintains the following data elements:

- **List:** An ordered list of **IUpdateDownloadContent** instances.
- **Count:** A count of the **IUpdateDownloadContent** instances in the list.

Once initialized, these data elements are not modified.

3.26.2 Timers

None.

3.26.3 Initialization

When the server is initialized, it SHOULD populate the ADM from update metadata.

3.26.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Item	Retrieves an item from the collection by index. Opnum: 8
NewEnum	Retrieves an enumerator over the collection. Opnum: 9
Count	Retrieves the number of items in the collection. Opnum: 10

All methods MUST NOT throw exceptions.

3.26.4.1 IUpdateDownloadContentCollection::Item (Opnum 8)

The **IUpdateDownloadContentCollection::Item (opnum 8)** method retrieves an item from the collection by index.

```
HRESULT Item(
    [in] LONG index,
    [out, retval] IUpdateDownloadContent** retval
);
```

index: The zero-based index of the item to retrieve.

retval: The item at the given *index*.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.
If the *index* is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the item at the given *index* in the **List** ADM element.

3.26.4.2 IUpdateDownloadContentCollection::_NewEnum (Opnum 9)

The **IUpdateDownloadContentCollection::_NewEnum (opnum 9)** method retrieves an enumerator over the collection.

```
HRESULT _NewEnum(
    [out, retval] IUnknown** retval
);
```

retval: The **IUnknown** interface of an object that also implements the **IEnumVARIANT** interface, which can be used to enumerate the elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return a newly created object implementing the **IEnumVARIANT** interface, which enumerates the items in the **List** ADM element.

3.26.4.3 IUpdateDownloadContentCollection::Count (Opnum 10)

The **IUpdateDownloadContentCollection::Count (opnum 10)** method retrieves the number of items in the collection.

```
HRESULT Count(
    [out, retval] LONG* retval
);
```

retval: The number of items in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.

- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Count** ADM element.

3.28 IUpdateException Server Details

The **IUpdateException** interface derives from the **IDispatch** interface and is an immutable representation of an error.

3.28.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateException** server maintains the following data elements:

- **Locale**: An [LCID](#) identifying the locale for localized strings maintained by this ADM.
- **Message**: A string containing a localized message describing the error.
- **HResult**: An **HRESULT** ([\[MS-ERREF\]](#) section 2.1) identifying the error.
- **Context**: A value from the [UpdateExceptionContext \(section 2.2.8\)](#) enumeration that describes context for the error.

Once initialized, these data elements are not modified.

3.28.2 Timers

None.

3.28.3 Initialization

When an instance is created, it SHOULD obtain the desired locale for localized data from the creating server through an implementation-dependent[`<31>`](#) interface and store that in the **Locale** ADM element. It SHOULD then populate its ADM from the results of an update search obtained from the update agent through an implementation-dependent[`<32>`](#) interface. Localized data SHOULD be loaded in the locale identified by the **Locale** ADM element.

3.28.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section [3](#).

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Message	Retrieves the message for this exception. Opnum: 8
HResult	Retrieves the HRESULT describing the error. Opnum: 9
Context	Retrieves the context for this exception. Opnum: 10

All methods MUST NOT throw exceptions.

3.28.4.1 IUpdateException::Message (Opnum 8)

The **IUpdateException::Message (opnum 8)** method retrieves the message for this exception.

```
HRESULT Message(
    [out, retval] BSTR* retval
);
```

retval: A localized message describing the error. If no message is available, *retval* MUST be set either to NULL or to the empty string.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Message** ADM element.

3.28.4.2 IUpdateException::HResult (Opnum 9)

The **IUpdateException::HResult (opnum 9)** method retrieves the **HRESULT** describing the error.

```
HRESULT HResult(
    [out, retval] LONG* retval
);
```

retval: An **HRESULT** code describing the error. The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **HResult** ADM element.

3.28.4.3 IUpdateException::Context (Opnum 10)

The **IUpdateException::Context (opnum 10)** method retrieves the context for the exception.

```
HRESULT Context(
    [out, retval] UpdateExceptionContext* retval
);
```

retval: A value from the [UpdateExceptionContext \(section 2.2.8\)](#) enumeration that describes the context for the exception.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Context** ADM element.

3.30 IUpdateExceptionCollection Server Details

The **IUpdateExceptionCollection** interface derives from the **IDispatch** interface and represents an immutable list of **IUpdateException** instances.

3.30.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations

adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateExceptionCollection** server maintains the following data elements:

- **List:** An ordered list of **IUpdateException** instances.
- **Count:** An integer count of the **IUpdateException** instances in the list.

Once initialized, these data elements are never modified.

3.30.2 Timers

None.

3.30.3 Initialization

When the server is created, it SHOULD populate its ADM from the results of an update search obtained from the update agent through an implementation-dependent [<33>](#) interface.

3.30.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section [3](#).

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Item	Retrieves an item from the collection by index. Opnum: 8
NewEnum	Retrieves an enumerator over the collection. Opnum: 9
Count	Retrieves the number of items in the collection. Opnum: 10

All methods MUST NOT throw exceptions.

3.30.4.1 IUpdateExceptionCollection::Item (Opnum 8)

The **IUpdateExceptionCollection::Item (opnum 8)** method retrieves an item from the collection by index.

```
HRESULT Item(
    [in] LONG index,
    [out, retval] IUpdateException** retval
);
```

index: The zero-based index of the item to retrieve.

retval: The item at the given *index*.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the *index* is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the item at the given *index* in the **List** ADM element.

3.30.4.2 IUpdateExceptionCollection::_NewEnum (Opnum 9)

The **IUpdateExceptionCollection::_NewEnum (opnum 9)** method retrieves an enumerator over the collection.

```
HRESULT _NewEnum(
    [out, retval] IUnknown** retval
);
```

retval: The **IUnknown** interface of an object that also implements the **IEnumVARIANT** interface, which can be used to enumerate the elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return a newly created object that implements the **IEnumVARIANT** interface, which enumerates the items in the List ADM element.

3.30.4.3 IUpdateExceptionCollection::Count (Opnum 10)

The **IUpdateExceptionCollection::Count (opnum 10)** method retrieves the number of items in the collection.

```
HRESULT Count(
    [out, retval] LONG* retval
);
```

retval: The number of items in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.

- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Count** ADM element.

3.32 IUpdateHistoryEntry and IUpdateHistoryEntry2 Server Details

The **IUpdateHistoryEntry** interface derives from the **IDispatch** method and represents an immutable record of an update-related operation and its result.

The **IUpdateHistoryEntry2** interface derives from the **IUpdateHistoryEntry** interface and provides additional data about an update-related operation.

3.32.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations

adhere to this model as long as their external behavior is consistent with that described in this document.

The server maintains the following data elements:

- **Locale:** An [LCID](#) identifying the locale for the localized data.
- **Operation:** A value from the [UpdateOperation \(section 2.2.10\)](#) enumeration that describes the operation performed.
- **ResultCode:** A value from the [OperationResultCode \(section 2.2.9\)](#) enumeration that describes the result of the operation.
- **HResult:** An **HRESULT** ([\[MS-ERREF\]](#) section 2.1) set to the result of the operation.
- **Date:** A **DATE** ([\[MS-OAUT\]](#) section 2.2.25) set to the date-time, in UTC, at which the operation was performed.
- **UpdateIdentity:** An **IUpdateIdentity** instance representing the identity for which the update operation was performed.
- **Title:** A string, in the language of the user who initiated the operation, containing the localized title of the update operation.
- **Description:** A string, in the language of the user who initiated the operation, containing the localized description of the update operation.
- **UnmappedresultCode:** A [LONG](#) containing the original result code from the operation, if it was not an **HRESULT**.
- **ClientApplicationId:** A string used to identify the application that initiated the operation.
- **ServerSelection:** A value from the [ServerSelection \(section 2.2.11\)](#) enumeration indicating the update service that provided the update for which the operation was performed.
- **ServiceID:** A string containing the unique identifier of the update service that provided the update for which the operation was performed. This is the string form of a UUID, as specified in [\[RFC4122\]](#) section 3.
- **UninstallationSteps:** A string, in the language of the user who initiated the operation, containing the localized uninstallation steps for the update for which the operation was performed.
- **UninstallationNotes:** A string, in the language of the user who initiated the operation, containing the localized uninstallation notes for the update for which the operation was performed.
- **SupportUrl:** A string containing the URL of a document containing support information for the update for which the operation was performed.
- **Categories:** An **ICategoryCollection** instance containing a list of categories to which the update for which the operation was performed belonged at the time of the operation.

Once initialized, these data elements are not modified.

3.32.2 Timers

None.

3.32.3 Initialization

When the server is created, it SHOULD populate its ADM from persisted history data obtained from the update agent through an implementation-dependent [34](#) interface. The **Locale** ADM element SHOULD be set to an [**LCID**](#) identifying the locale of the user that initiated the update operation recorded in the history entry, and localizable data elements SHOULD be localized to this locale.

3.32.4 Message Processing Events and Sequencing Rules for IUpdateHistoryEntry

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Operation	Retrieves the operation performed. Opnum: 8
ResultCode	Describes the result of the operation. Opnum: 9
HResult	Retrieves the HRESULT ([MS-ERREF] section 2.1) from the operation. Opnum: 10
Date	Retrieves the date-time that the operation was performed. Opnum: 11
UpdateIdentity	Retrieves the identity of the update for which the operation was performed. Opnum: 12
Title	Retrieves the title of the update for which the operation was performed. Opnum: 13
Description	Retrieves the description of the update for which the operation was performed. Opnum: 14
UnmappedresultCode	Retrieves an unmapped result code from the operation. Opnum: 15
ClientApplicationID	Retrieves the ID of the application that initiated the operation. Opnum: 16
ServerSelection	Retrieves a value describing the type of update service that provided the update for which the operation was performed. Opnum: 17
ServiceID	Retrieves the unique identifier of the update service that provided the update for which the operation was performed. Opnum: 18
UninstallationSteps	Retrieves the uninstallation steps for the update for which the operation was performed.

Method	Description
	Opnum: 18
<u>UninstallationNotes</u>	Retrieves the uninstallation notes for the update for which the operation was performed. Opnum: 20
<u>SupportUrl</u>	Retrieves the support URL for the update for which the operation was performed. Opnum: 21

All methods MUST NOT throw exceptions.

3.32.4.1 IUpdateHistoryEntry::Operation (Opnum 8)

The **IUpdateHistoryEntry::Operation (opnum 8)** method retrieves the operation performed.

```
HRESULT Operation(
    [out, retval] UpdateOperation* retval
);
```

retval: Indicates the operation that was performed.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Operation** ADM element.

3.32.4.2 IUpdateHistoryEntry::resultCode (Opnum 9)

The **IUpdateHistoryEntry::resultCode (opnum 9)** method describes the result of the operation.

```
HRESULT ResultCode(
    [out, retval] OperationResultCode* retval
);
```

retval: Specifies the result of the operation.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **ResultCode** ADM element.

3.32.4.3 IUpdateHistoryEntry::HResult (Opnum 10)

The **IUpdateHistoryEntry::HResult (opnum 10)** method retrieves the **HRESULT** from the operation.

```
HRESULT HResult(
    [out, retval] LONG* retval
);
```

retval: The HRESULT from the operation.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **HResult** ADM element.

3.32.4.4 IUpdateHistoryEntry::Date (Opnum 11)

The **IUpdateHistoryEntry::Date (opnum 11)** method retrieves the date-time that the operation was performed.

```
HRESULT Date(
    [out, retval] DATE* retval
);
```

retval: The date-time, in UTC, that the operation was performed.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **Date** ADM element.

3.32.4.5 IUpdateHistoryEntry::UpdateIdentity (Opnum 12)

The **IUpdateHistoryEntry::UpdateIdentity (opnum 12)** method retrieves the identity of the update for which the operation was performed.

```
HRESULT UpdateIdentity(
    [out, retval] IUpdateIdentity** retval
);
```

```
);
```

retval: The identity of the update for which the operation was performed.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **UpdateIdentity** ADM element.

3.32.4.6 IUpdateHistoryEntry::Title (Opnum 13)

The **IUpdateHistoryEntry::Title (opnum 13)** method retrieves the title of the update for which the operation was performed.

```
HRESULT Title(
    [out, retval] BSTR* retval
);
```

retval: The localized title of the update for which the operation is performed. The title SHOULD be in the language of the user who initiated the operation but MAY be in the language of the current calling user.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Title** ADM element.

3.32.4.7 IUpdateHistoryEntry::Description (Opnum 14)

The **IUpdateHistoryEntry::Description (opnum 14)** method retrieves the description of the update for which the operation is performed.

```
HRESULT Description(
    [out, retval] BSTR* retval
);
```

retval: The localized description of the update for which the operation is performed. The description SHOULD be in the language of the user who initiated the operation but MAY be in the language of the current calling user. If there is no description of the update, the retval MUST be set either to NULL or to the empty string.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **Description** ADM element.

3.32.4.8 IUpdateHistoryEntry::UnmappedresultCode (Opnum 15)

The **IUpdateHistoryEntry::UnmappedresultCode (opnum 15)** method retrieves an unmapped result code from the operation. If the operation produced a result code that is not an **HRESULT**, the unmapped result code SHOULD be set to that original result code. Otherwise, the unmapped result code SHOULD be 0x00000000.

```
HRESULT UnmappedresultCode(
    [out, retval] LONG* retval
);
```

retval: An unmapped code describing the result of the operation. If no unmapped result code exists, *retval* MUST be set to 0.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **UnmappedresultCode** ADM element.

3.32.4.9 IUpdateHistoryEntry::ClientApplicationID (Opnum 16)

The **IUpdateHistoryEntry::ClientApplicationID (opnum 16)** method retrieves the ID of the application that initiated the operation.

```
HRESULT ClientApplicationID(
    [out, retval] BSTR* retval
);
```

retval: A string identifying the client application that initiated the operation.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **ClientApplicationID** ADM element.

3.32.4.10 IUpdateHistoryEntry::ServerSelection (Opnum 17)

The **IUpdateHistoryEntry::ServerSelection (opnum 17)** method describes the type of update service that provided the update for which the operation was performed.

```
HRESULT ServerSelection(
    [out, retval] ServerSelection* retval
);
```

retval: A value from the [ServerSelection \(section 2.2.11\)](#) enumeration that indicates the type of update service that provided the update for which the operation was performed.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **ServerSelection** ADM element.

3.32.4.11 IUpdateHistoryEntry::ServiceID (Opnum 18)

The **IUpdateHistoryEntry::ServiceID (opnum 18)** method retrieves the unique identifier of the update service that provided the update for which the operation was performed.

```
HRESULT ServiceID(
    [out, retval] BSTR* retval
);
```

retval: A string containing the unique identifier of the update service that provided the update for which the operation was performed.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **ServiceID** ADM element.

3.32.4.12 IUpdateHistoryEntry::UninstallationSteps (Opnum 19)

The **IUpdateHistoryEntry::UninstallationSteps (opnum 19)** method retrieves the uninstallation steps for the update for which the operation was performed.

```
HRESULT UninstallationSteps(
    [out, retval] IStringCollection** retval
);
```

retval: An ordered list of human-readable localized steps for uninstalling the update for which this operation was performed. The uninstallation steps SHOULD be in the language of the user who initiated the operation but MAY be in the language of the current calling user. If no uninstallation steps are available, *retval* MUST be set to an empty **IStringCollection** list.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **UninstallationSteps** ADM element.

3.32.4.13 IUpdateHistoryEntry::UninstallationNotes (Opnum 20)

The **IUpdateHistoryEntry::UninstallationNotes (opnum 20)** method retrieves the uninstallation notes for the update for which the operation was performed.

```
HRESULT UninstallationNotes(
    [out, retval] BSTR* retval
);
```

retval: Uninstallation notes for the update for which the operation was performed. The uninstallation notes SHOULD be in the language of the user who initiated the operation but MAY be in the language of the current calling user. If no uninstallation notes are available, *retval* MUST be set either to NULL or to the empty string.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **UninstallationNotes** ADM element.

3.32.4.14 IUpdateHistoryEntry::SupportUrl (Opnum 21)

The **IUpdateHistoryEntry::SupportUrl (opnum 21)** method retrieves the support URL for the update for which the operation was performed.

```
HRESULT SupportUrl(
    [out, retval] BSTR* retval
);
```

retval: The URL for a document containing support information for the update for which this operation was performed. If no support information is available, *retval* MUST be set either to NULL or to the empty string.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the result of the **SupportUrl** ADM element.

3.32.5 Message Processing Events and Sequencing Rules for IUpdateHistoryEntry2

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Categories	Retrieves a collection of the update categories to which an update belongs. Opnum: 22

All methods MUST NOT throw exceptions.

3.32.5.1 IUpdateHistoryEntry2::Categories (Opnum 22)

The **IUpdateHistoryEntry2::Categories (opnum 22)** method retrieves a collection of the update categories to which an update belongs.

```
HRESULT Categories(
    [out, retval] ICatCategoryCollection** retval
);
```

retval: A collection of the update categories to which an update belongs.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of its **Categories** ADM element.

3.32.6 Timer Events

None.

3.32.7 Other Local Events

None.

3.33 IUpdateHistoryEntry and IUpdateHistoryEntry2 Client Details

3.33.1 Abstract Data Model

None.

3.33.2 Timers

None.

3.33.3 Initialization

None.

3.33.4 Message Processing Events and Sequencing Rules

To retrieve an **IUpdateHistoryEntry** instance, a client MUST call the [IUpdateHistoryEntryCollection::Item \(opnum 8\) \(section 3.34.4.1\)](#) method.

To retrieve an **IUpdateHistoryEntry2** instance, a client MUST first retrieve an **IUpdateHistoryEntry** interface and then call the **IUnknown::QueryInterface** method to obtain an **IUpdateHistoryEntry2** interface.

3.33.5 Timer Events

None.

3.33.6 Other Local Events

None.

3.34 IUpdateHistoryEntryCollection Server Details

The **IUpdateHistoryEntryCollection** interface derives from the **IDispatch** interface and represents an immutable list of **IUpdateHistoryEntry** instances.

3.34.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateHistoryEntryCollection** server maintains the following data elements:

- **List:** An ordered list of **IUpdateHistoryEntry** instances.
- **Count:** An integer count of the **IUpdateHistoryEntry** instances in the list.

Once initialized, these data elements are never modified.

3.34.2 Timers

None.

3.34.3 Initialization

When the server is created, it SHOULD populate its ADM from persisted history data obtained from the update agent through an implementation-dependent[<35>](#) interface.

3.34.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section [3](#).

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
<u>Item</u>	Retrieves an item from the collection by index. Opnum: 8
<u>NewEnum</u>	Retrieves an enumerator over the collection. Opnum: 9
<u>Count</u>	Retrieves the number of items in the collection. Opnum: 10

All methods MUST NOT throw exceptions.

3.34.4.1 IUpdateHistoryEntryCollection::Item (Opnum 8)

The **IUpdateHistoryEntryCollection::Item (opnum 8)** method retrieves an item from the collection by index.

```
HRESULT Item(
    [in] LONG index,
    [out, retval] IUpdateHistoryEntry** retval
```

```
) ;
```

index: The zero-based index of the item to retrieve.

retval: The item at the given *index*.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the *index* is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD return the item at the given *index* in the **List** ADM element.

3.34.4.2 IUpdateHistoryEntryCollection::_NewEnum (Opnum 9)

The **IUpdateHistoryEntryCollection::_NewEnum (opnum 9)** method retrieves an enumerator over the collection.

```
HRESULT _NewEnum(
    [out, retval] IUnknown** retval
);
```

retval: The **IUnknown** interface of an object that also implements the **IEnumVariant** interface, which can be used to enumerate the elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return a newly created object that implements **IEnumVariant** and that enumerates the items in the **List** ADM element.

3.34.4.3 IUpdateHistoryEntryCollection::Count (Opnum 10)

The **IUpdateHistoryEntryCollection::Count (opnum 10)** method retrieves the number of items in the collection.

```
HRESULT Count(
    [out, retval] LONG* retval
);
```

retval: The number of items in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Count** ADM element.

3.34.5 Timer Events

None.

3.34.6 Other Local Events

None.

3.35 IUpdateHistoryEntryCollection Client Details

3.35.1 Abstract Data Model

None.

3.35.2 Timers

None.

3.35.3 Initialization

None.

3.35.4 Message Processing Events and Sequencing Rules

To obtain an **IUpdateHistoryEntryCollection** instance, a client MUST call one of the following methods:

- [IUpdateSearcher::QueryHistory](#)
- [IUpdateSession3::QueryHistory](#)

3.35.5 Timer Events

None.

3.35.6 Other Local Events

None.

3.36 IUpdateIdentity Server Details

The **IUpdateIdentity** interface derives from the **IDispatch** interface and represents an immutable, globally unique update identity.

3.36.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateIdentity** server maintains the following data elements:

- **UpdateID:** A string that uniquely identifies an update.
- **RevisionNumber:** An integer revision number that indicates the revision of the update.

Once initialized, these data elements are not modified.

3.36.2 Timers

None.

3.36.3 Initialization

When the server is created, it SHOULD populate its ADM from data obtained from the update agent through an implementation-dependent[<36>](#) interface.

3.36.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
<u>RevisionNumber</u>	Retrieves the revision number of the update. Opnum: 8
<u>UpdateID</u>	Retrieves a globally unique string identifying the update. Opnum: 9

All methods MUST NOT throw exceptions.

3.36.4.1 IUpdateIdentity::RevisionNumber (Opnum 8)

The **IUpdateIdentity::RevisionNumber** method retrieves the revision number of the update.

```
HRESULT RevisionNumber(  
    [out, retval] LONG* retval
```

) ;

retval: The revision number of the update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **RevisionNumber** ADM element.

3.36.4.2 IUpdateIdentity::UpdateID (Opnum 9)

The **IUpdateIdentity::UpdateID (opnum 9)** method retrieves a globally unique string identifying the update.

```
HRESULT UpdateID(
    [out, retval] BSTR* retval
);
```

retval: A globally unique string that identifies an update.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **UpdateID** ADM element.

3.36.5 Timer Events

None.

3.36.6 Other Local Events

None.

3.37 IUpdateIdentity Client Details

3.37.1 Abstract Data Model

None.

3.37.2 Timers

None.

3.37.3 Initialization

None.

3.37.4 Message Processing Events and Sequencing Rules

To obtain an **IUpdateIdentity** instance, a client MUST call one of the following methods:

- [**IUpdate::Identity \(section 3.20.4.13\)**](#)
- [**IUpdateHistoryEntry::UpdateIdentity \(section 3.32.4.5\)**](#)

3.37.5 Timer Events

None.

3.38 IUpdateSearcher, IUpdateSearcher2, and IUpdateSearcher3 Server Details

The **IUpdateSearcher** interface derives from the **IDispatch** interface and defines methods to perform an update search operation and properties to configure the behavior of searches initiated through that **IUpdateSearcher** instance.

The **IUpdateSearcher2** interface derives from the **IUpdateSearcher** interface and defines additional properties to configure the behavior of update searches.

The **IUpdateSearcher3** interface derives from the **IUpdateSearcher2** interface and defines additional properties to configure the behavior of update searches.

3.38.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateSearcher** server maintains the following data elements:

- **Locale:** An [**LCID**](#) identifying the locale for localized data returned from method calls on instances in the object graph returned by method calls on this instance. Once initialized, this data element is not modified.
- **CanAutomaticallyUpgradeService:** A VARIANT_BOOL that controls whether a search performed by using this instance can automatically upgrade the update agent. This data element can be modified.
- **ClientApplicationID:** The string used to identify the client application that is using this instance. This data element can be modified.

- **IncludePotentiallySupersededUpdates:** A VARIANT_BOOL that controls whether a search performed by using this instance includes updates that are superseded by other updates in the search results. This data element can be modified.
- **ServerSelection:** A value from the [ServerSelection \(section 2.2.11\)](#) enumeration indicating the type of update server to be used to perform searches by using this instance. This data element can be modified.
- **ServiceID:** A string containing the unique identifier of the update server to be used to perform searches by using this instance. This data element can be modified.
- **HistoryList:** A list of **IUpdateHistoryEntry** instances representing all history entries recorded by the update agent, sorted by date in descending order. Once initialized, this data element is never modified.
- **HistoryCount:** A count of the items in **HistoryList**. Once initialized, this data element is not modified.
- **Online:** A VARIANT_BOOL that controls whether a search performed by using this instance should go online. This data element can be modified.
- **IgnoreDownloadPriority:** A VARIANT_BOOL that, if set to VARIANT_TRUE, causes an update's download priority to be ignored when computing update supersedence. This data element can be modified.
- **SearchScope:** A value from the [SearchScope \(section 2.2.12\)](#) enumeration indicating the scope of the search operation. This data element can be modified.

3.38.2 Timers

None.

3.38.3 Initialization

When the server is created, it SHOULD initialize its ADM as follows:

- **Locale:** Set to the value of the **UserLocale** ADM element of the **IUpdateSession** (or **IUpdateSession**-derived interface) instance from which this instance was created. This value is obtained through an implementation-dependent [<37>](#) interface.
- **CanAutomaticallyUpgradeService:** Set to VARIANT_FALSE.
- **ClientApplicationID:** Set to the empty string.
- **IncludePotentiallySupersededUpdates:** Set to VARIANT_FALSE.
- **ServerSelection:** Set to ssDefault.
- **ServiceID:** Set to NULL.
- **HistoryList:** Populated from the update agent's persistently stored history through an implementation-dependent interface. [<38>](#)
- **HistoryCount:** Populated from the update agent's persistently stored history through an implementation-dependent interface. [<39>](#)
- **Online:** Set to VARIANT_TRUE.

- **IgnoreDownloadPriority:** Set to VARIANT_FALSE.
- **SearchScope:** Set to searchScopeDefault.

3.38.4 Message Processing Events and Sequencing Rules for IUpdateSearcher

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
CanAutomaticallyUpgradeService	Retrieves whether a search performed by using this interface can automatically upgrade the update agent. Opnum: 8
CanAutomaticallyUpgradeService	Sets whether a search performed by using this interface can automatically upgrade the update agent. Opnum: 9
ClientApplicationID	Retrieves the string used to identify the current client application. Opnum: 10
ClientApplicationID	Sets the string used to identify the current client application. Opnum: 11
IncludePotentiallySupersededUpdates	Retrieves whether the search results include updates that are superseded by other updates in the search results. Opnum: 12
IncludePotentiallySupersededUpdates	Sets whether the search results include updates that are superseded by other updates in the search results. Opnum: 13
ServerSelection	Retrieves the server used to search against. Opnum: 14
ServerSelection	Sets the server used to search against. Opnum: 15
Opnum16NotUsedOnWire	Reserved for local use. Opnum: 16
Opnum17NotUsedOnWire	Reserved for local use. Opnum: 17
EscapeString	Escapes a string such that it can be used as a literal value in a search criteria string. Opnum: 18
QueryHistory	Retrieves a collection of history events.

Method	Description
	Opnum: 19
<u>Search</u>	Performs an update search. Opnum: 20
<u>Online</u>	Retrieves whether a search performed by using this interface is an online search. Opnum: 21
<u>Online</u>	Sets whether a search performed by using this interface is an online search. Opnum: 22
<u>GetTotalHistoryCount</u>	Retrieves the total number of history events stored on the computer. Opnum: 23
<u>ServiceID</u>	Retrieves the server used to search against. Opnum: 24
<u>ServiceID</u>	Sets the server used to search against. Opnum: 25

In the table above, the term "Reserved for local use" means that the client MUST NOT send the opnum, and the server behavior is undefined<40> since it does not affect interoperability.

All methods MUST NOT throw exceptions.

3.38.4.1 IUpdateSearcher::CanAutomaticallyUpgradeService (Opnum 8)

The **IUpdateSearcher::CanAutomaticallyUpgradeService (opnum 8)** method retrieves whether the update agent can automatically upgrade itself before performing a search initiated through this instance.

```
HRESULT CanAutomaticallyUpgradeService(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be VARIANT_TRUE if the update agent can automatically upgrade itself before performing a search initiated through this instance, or VARIANT_FALSE otherwise.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **CanAutomaticallyUpgradeService** ADM element.

3.38.4.2 IUpdateSearcher::CanAutomaticallyUpgradeService (Opnum 9)

The **IUpdateSearcher::CanAutomaticallyUpgradeService** (opnum 9) method sets whether the update agent can automatically upgrade itself before performing a search initiated through this instance.

```
HRESULT CanAutomaticallyUpgradeService(
    [in] VARIANT_BOOL value
);
```

value: Set to VARIANT_TRUE to allow the update agent to automatically upgrade itself, if it is an older version, before performing a search through this instance; otherwise, set to VARIANT_FALSE to disallow automatic upgrading of the update agent.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If value is neither VARIANT_TRUE nor VARIANT_FALSE, this method MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the value of the **CanAutomaticallyUpgradeService** ADM element to the contents of the *value* parameter.

3.38.4.3 IUpdateSearcher::ClientApplicationID (Opnum 10)

The **IUpdateSearcher::ClientApplicationID** (opnum 10) method retrieves the string used to identify the current client application.

```
HRESULT ClientApplicationID(
    [out, retval] BSTR* retval
);
```

retval: Returns a string identifying the client application using the interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ClientApplicationID** ADM element.

3.38.4.4 IUpdateSearcher::ClientApplicationID (Opnum 11)

The **IUpdateSearcher::ClientApplicationID** (opnum 11) method sets the string used to identify the current client application.

```
HRESULT ClientApplicationID(
    [in] BSTR value
);
```

value: A string used to identify the client application using the interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the value of the **ClientApplicationID** ADM element to the contents of the *value* parameter.

3.38.4.5 IUpdateSearcher::IncludePotentiallySupersededUpdates (Opnum 12)

The **IUpdateSearcher::IncludePotentiallySupersededUpdates** (opnum 12) method retrieves whether the search results include updates that are superseded by other updates in the search results.

```
HRESULT IncludePotentiallySupersededUpdates(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: Indicates whether the results of searches performed by using this interface include updates that are superseded by other updates.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IncludePotentiallySupersededUpdates** ADM element.

3.38.4.6 IUpdateSearcher::IncludePotentiallySupersededUpdates (Opnum 13)

The **IUpdateSearcher::IncludePotentiallySupersededUpdates** (opnum 13) method sets whether the search results include updates that are superseded by other updates in the search results.

```
HRESULT IncludePotentiallySupersededUpdates(
    [in] VARIANT_BOOL value
);
```

value: Indicates whether the results of searches performed by using this interface include updates that are superseded by other updates.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If value is neither VARIANT_TRUE nor VARIANT_FALSE, this method MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the value of the **IncludePotentiallySupersededUpdates** ADM element to the value given.

3.38.4.7 IUpdateSearcher::ServerSelection (Opnum 14)

The **IUpdateSearcher::ServerSelection (opnum 14)** method retrieves the type of update server used to search against.

```
HRESULT ServerSelection(
    [out, retval] ServerSelection* retval
);
```

retval: A value from the [ServerSelection \(section 2.2.11\)](#) enumeration that indicates the type of update server against which to perform search operations initiated by using this interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ServerSelection** ADM element.

3.38.4.8 IUpdateSearcher::ServerSelection (Opnum 15)

The **IUpdateSearcher::ServerSelection (Opnum 15)** method sets the type of update server used to search against.

```
HRESULT ServerSelection(
    [in] ServerSelection value
);
```

value: A value from the [ServerSelection \(section 2.2.11\)](#) enumeration that indicates the type of update server against which to perform search operations initiated by using this interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the **ServerSelection** ADM element to the *value* parameter.

3.38.4.9 IUpdateSearcher::EscapeString (Opnum 18)

The **IUpdateSearcher::EscapeString (opnum 18)** method escapes a string such that it can be used as a literal value in a search criteria string.

```
HRESULT EscapeString(
    [in] BSTR unescaped,
    [out, retval] BSTR* retval
);
```

unescaped: The string to escape.

retval: Resulting escaped string.

Strings MUST be escaped as follows: all single-quote ('), open square bracket ([]), and close square bracket ()) characters in the unescaped string must be replaced with [''], [[], and []] sequences, respectively.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method MUST return the escaped string.

3.38.4.10 IUpdateSearcher::QueryHistory (Opnum 19)

The **IUpdateSearcher::QueryHistory (opnum 19)** method retrieves a collection of history events.

```
HRESULT QueryHistory(
    [in] LONG startIndex,
    [in] LONG count,
    [out, retval] IUpdateHistoryEntryCollection** retval
);
```

startIndex: The zero-based index of the first history entry to retrieve.

count: The number of entries to retrieve.

retval: An **IUpdateHistoryEntryCollection** containing the history entries requested. If fewer entries are available than requested in the *count* parameter, only the entries available are retrieved.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the *startIndex* value is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server MUST return an **IUpdateHistoryEntryCollection** instance containing the following history entries, sorted by date in descending order:

- Only history entries starting from the given *startIndex*.
- A maximum of *count* history entries, starting from *startIndex*.

This method SHOULD derive these history entries from the **HistoryList** ADM element.

3.38.4.11 IUpdateSearcher::Search (Opnum 20)

The **IUpdateSearcher::Search (opnum 20)** method performs an update search.

```
HRESULT Search(
    [in] BSTR criteria,
    [out, retval] ISearchResult** retval
);
```

criteria: A string specifying criteria that updates are required to meet in order to be returned in the search results.

The server MUST support criteria specified by the following ABNF grammar.

```
criteria = andgroup *[1,*WSP "or" 1,*WSP andgroup] /
andgroup = andgroup *[1,*WSP "and" 1,*WSP andgroup] / "(" *WSP andgroup *WSP ")" /
criterion

criterion = propertyname *WSP operator *WSP value / "(" *WSP criterion *WSP ")"

propertyname = "Type" / "DeploymentAction" / "IsAssigned" /
"AutoSelectOnWebsSites" / "BrowseOnly" / "UpdateID" / "RevisionNumber" /
"CategoryIDs" / "IsInstalled" / "IsHidden" / "IsPresent" /
"RebootRequired"
```

```

operator = "=" / "!=" / "contains"
value = string / integer
string = "" *CHAR ""
integer = ["-"] 1*DIGIT

```

The CHAR and DIGIT production rules are specified in [\[RFC5234\]](#) section B.1.

Integer values MUST be specified in base 10. String values MUST be escaped (using the [IUpdateSearcher::EscapeString \(opnum 18\)](#) method) before being enclosed in single quotation marks, as specified by the preceding grammar. String comparisons MUST be case-insensitive.

The server MUST support the following update properties with the given operators and value types.

Update property name	Operators supported	Value type	Description
Type	=, !=	String	Compares the update's type to that given.
DeploymentAction	=	String	Finds updates with the given deployment action. If this criterion is not specified, the search operation MUST return only updates with a DeploymentAction of "Installation".
IsAssigned	=	Integer MUST be 0 or 1	The value is treated as a Boolean. The value determines whether the search operation finds updates that are intended for processing by an automatic update agent.
AutoSelectOnWebsites	=	Integer MUST be 0 or 1	The value is treated as a Boolean. The value determines whether the search operation finds updates that are intended to be automatically selected from web user interfaces.
BrowseOnly	=	Integer MUST be 0 or 1	The value is treated as a Boolean. The value determines whether the search operation finds updates that are not intended for processing by an automatic update agent.
UpdateID	=, !=	String	Compares the update's ID to that given.
RevisionNumber	=	Integer	Finds updates with the given revision number.
CategoryIDs	Contains	String	Finds updates belonging to the given category.
IsInstalled	=	Integer MUST be 0 or 1	The value is treated as a Boolean. The value determines whether the search operation finds updates that are installed.

Update property name	Operators supported	Value type	Description
		1	
IsHidden	=	Integer MUST be 0 or 1	The value is treated as a Boolean. The value determines whether the search operation finds updates that have been hidden by a user.
IsPresent	=	Integer MUST be 0 or 1	The value is treated as a Boolean. The value determines whether the search operation finds updates that are present, that is, updates that have been installed for one or more products.
RebootRequired	=	Integer MUST be 0 or 1	The value is treated as a Boolean. The value determines whether the search operation finds updates that currently require a reboot to complete installation or uninstallation.

retval: An **ISearchResult** instance with the results of the search.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the criteria string cannot be parsed by the search criteria grammar specified preceding, the method MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

The server SHOULD trigger the update agent to perform an update search through an implementation-dependent[`<41>`](#) interface.

The update search MUST be restricted to updates meeting the *criteria* specified. If the *criteria* parameter is NULL or the empty string, the server SHOULD trigger the update agent to use default search criteria, as defined by the update agent.

If the value of the **CanAutomaticallyUpgradeService** ADM element is VARIANT_TRUE, the search operation MAY automatically upgrade the update agent.

If the value of the **IncludePotentiallySupersededUpdates** ADM element is VARIANT_TRUE, the search operation results SHOULD include updates superseded by other updates in the search results. Otherwise, the search operation results SHOULD NOT include updates superseded by other updates in the search results.

If the value of the **Online** ADM element is VARIANT_TRUE, the search operation SHOULD go online.

The following table specifies the update server against which the search operation SHOULD be performed.

Value of the ServerSelection ADM element	Update server to search against
ssDefault	Implementation-defined by the update agent.
ssManagedServer	An update server managed by an administrator.
ssWindowsUpdate	The Windows Update update server
ssOthers	The update server identified by the value of the ServiceID ADM element.

If the value of the **IgnoreDownloadPriority** ADM element is VARIANT_TRUE, the search operation SHOULD ignore the download priority of updates when computing update supersedence.

The following table specifies the set of updates for which the search operation SHOULD be performed.

Value of the SearchScope ADM element	Updates to search for
searchScopeDefault	Per-machine updates only.
searchScopeMachineOnly	Per-machine updates only.
searchScopeCurrentUserOnly	Per-user updates for the calling user only.
searchScopeMachineAndCurrentUser	Per-machine updates and per-user updates for the calling user.
searchScopeMachineAndAllUsers	Per-machine updates and per-user updates for all users.
searchScopeAllUsers	Per-user updates for all users.

3.38.4.12 IUpdateSearcher::Online (Opnum 21)

The **IUpdateSearcher::Online (opnum 21)** method retrieves whether a search performed by using this interface is an online search.

```
HRESULT Online(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the search operation can contact the server or to VARIANT_FALSE if it uses local data only.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Online** ADM element.

3.38.4.13 IUpdateSearcher::Online (Opnum 22)

The **IUpdateSearcher::Online (opnum 22)** method sets whether a search performed by using this interface is an online search.

```
HRESULT Online(
    [in] VARIANT_BOOL value
);
```

value: MUST be set either to VARIANT_TRUE if the search operation can contact the server or to VARIANT_FALSE if it uses local data only.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If value is neither VARIANT_TRUE nor VARIANT_FALSE, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the value of the **Online** ADM element to the *value* parameter.

3.38.4.14 IUpdateSearcher::GetTotalHistoryCount (Opnum 23)

The **IUpdateSearcher::GetTotalHistoryCount (opnum 23)** method retrieves the total number of history events stored on the computer.

```
HRESULT GetTotalHistoryCount(
    [out, retval] LONG* retval
);
```

retval: The total number of history entries stored on the computer.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **HistoryCount** ADM element.

3.38.4.15 IUpdateSearcher::ServiceID (Opnum 24)

The **IUpdateSearcher::ServiceID (opnum 24)** method retrieves the unique identifier of the update server used to search against.

```

HRESULT ServiceID(
    [out, retval] BSTR* retval
);

```

retval: A string containing the unique identifier of the update server to use for search.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ServiceID** ADM element.

3.38.4.16 IUpdateSearcher::ServiceID (Opnum 25)

The **IUpdateSearcher::ServiceID (opnum 25)** method sets the unique identifier of the update server used to search against.

```

HRESULT ServiceID(
    [in] BSTR value
);

```

value: A string containing the unique identifier of the update server to use for the search.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the value of the **ServiceID** ADM element to that given.

3.38.5 Message Processing Events and Sequencing Rules for IUpdateSearcher2

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
IgnoreDownloadPriority	Retrieves whether update download priority should be ignored. Opnum: 26

Method	Description
IgnoreDownloadPriority	Sets whether update download priority should be ignored. Opnum: 27

All methods MUST NOT throw exceptions.

3.38.5.1 IUpdateSearcher2::IgnoreDownloadPriority (Opnum 26)

The **IUpdateSearcher2::IgnoreDownloadPriority (opnum 26)** method retrieves whether the update download priority should be ignored.

```
HRESULT IgnoreDownloadPriority(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if download priority should be ignored when computing supersedence or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IgnoreDownloadPriority** ADM element.

3.38.5.2 IUpdateSearcher2::IgnoreDownloadPriority (Opnum 27)

The **IUpdateSearcher2::IgnoreDownloadPriority (opnum 27)** method sets whether the update download priority should be ignored.

```
HRESULT IgnoreDownloadPriority(
    [in] VARIANT_BOOL value
);
```

value: MUST be set either to VARIANT_TRUE if download priority should be ignored when computing supersedence or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If value is neither VARIANT_TRUE nor VARIANT_FALSE, the method MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the value of the **IgnoreDownloadPriority** ADM element to the *value* parameter.

3.38.6 Message Processing Events and Sequencing Rules for IUpdateSearcher3

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
SearchScope	Returns the scope of the search. Opnum: 28
SearchScope	Sets the scope of the search. Opnum: 29

All methods MUST NOT throw exceptions.

3.38.6.1 IUpdateSearcher3::SearchScope (Opnum 28)

The **IUpdateSearcher3::SearchScope (opnum 28)** method returns the scope of the search.

```
HRESULT SearchScope(
    [out, retval] SearchScope* retval
);
```

retval: The scope of searches initiated by using this interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **SearchScope** ADM element.

3.38.6.2 IUpdateSearcher3::SearchScope (Opnum 29)

The **IUpdateSearcher3::SearchScope (opnum 29)** method sets the scope of the search.

```
HRESULT SearchScope(
    [in] SearchScope value
);
```

value: The scope of searches initiated by using this interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the **SearchScope** ADM element to the given *value* parameter.

3.38.7 Timer Events

None.

3.38.8 Other Local Events

None.

3.39 IUpdateSearcher, IUpdateSearcher2, and IUpdateSearcher3 Client Details

3.39.1 Abstract Data Model

None.

3.39.2 Timers

None.

3.39.3 Initialization

None.

3.39.4 Message Processing Events and Sequencing Rules

To obtain an **IUpdateSearcher** instance, a client MUST call the [IUpdateSession::CreateUpdateSearcher \(section 3.16.4.4\)](#) method.

To obtain an **IUpdateSearcher2** instance, a client MUST first obtain an **IUpdateSearcher** interface and then call the **IUnknown::QueryInterface** method to obtain an **IUpdateSearcher2** interface.

To obtain an **IUpdateSearcher3** instance, a client MUST first obtain an **IUpdateSearcher** interface and then call the **IUnknown::QueryInterface** method to obtain an **IUpdateSearcher3** interface.

3.39.5 Timer Events

None.

3.39.6 Other Local Events

3.40 IUpdateService and IUpdateService2 Server Details

The **IUpdateService** interface derives from the **IDispatch** interface and is an immutable representation of an update server.

The **IUpdateService2** interface derives from the **IUpdateService** interface and provides additional data about an update server.

3.40.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateService** server maintains the following data elements:

- **Name:** A string containing the name of the update service.
- **ContentValidationCert:** An array of bytes containing the cryptographic hash of the certificate used to sign content delivered by the update service.
- **ExpirationDate:** A **DATE** ([\[MS-OAUT\]](#) section 2.2.25) set to the date on which the authorization cabinet file for the update service expires.
- **IsManaged:** A VARIANT_BOOL that indicates whether the update service is managed by an administrator.
- **IsRegisteredWithAU:** A VARIANT_BOOL that indicates whether the update service is registered with the automatic update agent.
- **IssueDate:** A **DATE** set to the date on which the authorization cabinet file for the update service was issued.
- **OffersWindowsUpdates:** A VARIANT_BOOL that indicates whether the update service offers updates for Windows.
- **RedirectUrls:** An **IStringCollection** instance containing URLs of the redirector cabinet files for the update service.
- **ServiceID:** A string containing the unique identifier for the update service.
- **IsScanPackageService:** A VARIANT_BOOL that indicates whether the update service is based on a **scan package**.
- **CanRegisterWithAU:** A VARIANT_BOOL that indicates whether the update service can be registered with the automatic update agent.
- **ServiceUrl:** A string containing the URL for the update service.
- **SetupPrefix:** A string containing the path prefix for the setup files provided by this update service for the update agent.
- **IsDefaultAUService:** A VARIANT_BOOL that indicates whether this update service is the default update service for the automatic update agent.

Once initialized, these data elements are not modified.

3.40.2 Timers

None.

3.40.3 Initialization

When the server is created, it SHOULD populate its ADM from persisted update service data obtained from the update agent through an implementation-dependent interface.

3.40.4 Message Processing Events and Sequencing Rules for IUpdateService

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Name	Retrieves the name of the update service. Opnum: 8
ContentValidationCert	Retrieves a cryptographic hash of the certificate used to sign content delivered by the service. Opnum: 9
ExpirationDate	Retrieves the date on which the authorization cabinet file for the service expires. Opnum: 9
IsManaged	Retrieves whether the service is a managed service. Opnum: 11
IsRegisteredWithAU	Retrieves whether the service is registered with the automatic update agent. Opnum: 12
IssueDate	Retrieves the date on which the authorization cabinet file for the service was issued. Opnum: 13
OffersWindowsUpdates	Retrieves whether the service offers updates for Windows. Opnum: 14
RedirectUrls	Retrieves a collection of URLs that provide the locations of the redirector cabinet files for the service. Opnum: 15
ServiceID	Retrieves the unique identifier for the service. Opnum: 16
IsScanPackageService	Retrieves whether the service is based on a scan package. Opnum: 17
CanRegisterWithAU	Retrieves whether the service can be registered with the automatic update

Method	Description
	agent. Opnum: 18
ServiceUrl	Retrieves the URL for the service. Opnum: 19
SetupPrefix	Retrieves the prefix for the setup files for this service. Opnum: 20

All methods MUST NOT throw exceptions.

3.40.4.1 IUpdateService::Name (Opnum 8)

The **IUpdateService::Name (opnum 8)** method retrieves the name of the update service.

```
HRESULT Name(
    [out, retval] BSTR* retval
);
```

retval: The name of the service.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Name** ADM element.

3.40.4.2 IUpdateService::ContentValidationCert (Opnum 9)

The **IUpdateService::ContentValidationCert (opnum 9)** method retrieves a cryptographic hash of the certificate used to sign content delivered by this update service.

```
HRESULT ContentValidationCert(
    [out, retval] VARIANT* retval
);
```

retval: An array of bytes containing the hash. The **vt** member MUST be set to **VT_ARRAY | VT_UI1**, and the **parray** member MUST contain a pointer to the array.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ContentValidationCert** ADM element.

3.40.4.3 IUpdateService::ExpirationDate (Opnum 10)

The **IUpdateService::ExpirationDate (opnum 10)** method retrieves the date on which the authorization cabinet file for the update service expires.

```
HRESULT ExpirationDate(
    [out, retval] DATE* retval
);
```

retval: The expiration date, in UTC.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ExpirationDate** ADM element.

3.40.4.4 IUpdateService::IsManaged (Opnum 11)

The **IUpdateService::IsManaged (opnum 11)** method retrieves whether the update service is managed by an administrator.

```
HRESULT IsManaged(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the service is a managed service or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IsManaged** ADM element.

3.40.4.5 IUpdateService::IsRegisteredWithAU (Opnum 12)

The **IUpdateService::IsRegisteredWithAU (opnum 12)** method retrieves whether the update service is registered with the automatic update agent.

```
HRESULT IsRegisteredWithAU(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the service is registered with the automatic update agent or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IsRegisteredWithAU** ADM element.

3.40.4.6 IUpdateService::IssueDate (Opnum 13)

The **IUpdateService::IssueDate (opnum 13)** method retrieves the date on which the authorization cabinet file for the update service was issued.

```
HRESULT IssueDate(
    [out, retval] DATE* retval
);
```

retval: The issue date.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IssueDate** ADM element.

3.40.4.7 IUpdateService::OffersWindowsUpdates (Opnum 14)

The **IUpdateService::OffersWindowsUpdates (opnum 14)** method retrieves whether the update service offers updates for Windows.

```
HRESULT OffersWindowsUpdates(
    [out, retval] VARIANT_BOOL* retval
);
```

```
);
```

retval: MUST be set either to VARIANT_TRUE if the service offers updates for Windows or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **OffersWindowsUpdates** ADM element.

3.40.4.8 IUpdateService::RedirectUrls (Opnum 15)

The **IUpdateService::RedirectUrls (opnum 15)** method retrieves a collection of URLs that provide the locations of the redirector cabinet files for the update service.

```
HRESULT RedirectUrls(
    [out, retval] IStringCollection** retval
);
```

retval: An **IStringCollection** instance containing URLs.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **RedirectUrls** ADM element.

3.40.4.9 IUpdateService::ServiceID (Opnum 16)

The **IUpdateService::ServiceID (opnum 16)** method retrieves the unique identifier for the update service.

```
HRESULT ServiceID(
    [out, retval] BSTR* retval
);
```

retval: A string uniquely identifying the service.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ServiceID** ADM element.

3.40.4.10 IUpdateService::IsScanPackageService (Opnum 17)

The **IUpdateService::IsScanPackageService (opnum 17)** method retrieves whether the update service is based on a scan package.

```
HRESULT IsScanPackageService(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the update service is based on a scan package or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IsScanPackageService** ADM element.

3.40.4.11 IUpdateService::CanRegisterWithAU (Opnum 18)

The **IUpdateService::CanRegisterWithAU (opnum 18)** method retrieves whether the update service can be registered with the automatic update agent.

```
HRESULT CanRegisterWithAU(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the update service can be registered with the automatic update agent or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **CanRegisterWithAU** ADM element.

3.40.4.12 IUpdateService::ServiceUrl (Opnum 19)

The **IUpdateService::ServiceUrl (opnum 19)** method retrieves the URL for the update service.

```
HRESULT ServiceUrl(
    [out, retval] BSTR* retval
);
```

retval: The URL for the update service.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ServiceUrl** ADM element.

3.40.4.13 IUpdateService::SetupPrefix (Opnum 20)

The **IUpdateService::SetupPrefix (opnum 20)** method retrieves the prefix for the setup files for this update service.

```
HRESULT SetupPrefix(
    [out, retval] BSTR* retval
);
```

retval: The prefix for setup files.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **SetupPrefix** ADM element.

3.40.5 Message Processing Events and Sequencing Rules for IUpdateService2

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
IsDefaultAUService	Retrieves whether this service is the default service for the automatic update agent. Opnum: 21

All methods MUST NOT throw exceptions.

3.40.5.1 IUpdateService2::IsDefaultAUService (Opnum 21)

The **IUpdateService2::IsDefaultAUService (opnum 21)** method retrieves whether this update service is the default update service for the automatic update agent.

```
HRESULT IsDefaultAUService(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the service is the default service for the automatic update agent or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IsDefaultAUService** ADM element.

3.40.6 Timer Events

None.

3.40.7 Other Local Events

None.

3.41 IUpdateService and IUpdateService2 Client Details

3.41.1 Abstract Data Model

None.

3.41.2 Timers

None.

3.41.3 Initialization

None.

3.41.4 Message Processing Events and Sequencing Rules

To obtain an **IUpdateService** instance, a client MUST call one of the following methods:

- [**IUpdateServiceManager::AddScanPackageService \(opnum 13\) \(section 3.44.4.4\)**](#)
- [**IUpdateServiceCollection::Item \(opnum 8\) \(section 3.42.4.1\)**](#)

To obtain an **IUpdateService2** instance, a client MUST obtain an **IUpdateService** instance and then call the **IUnknown::QueryInterface** method to obtain an **IUpdateService2** interface.

3.41.5 Timer Events

None.

3.41.6 Other Local Events

None.

3.42 IUpdateServiceCollection Server Details

The **IUpdateServiceCollection** interface derives from the **IDispatch** interface and is an immutable collection of update services.

3.42.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateServiceCollection** server maintains the following data elements:

- **List:** A list of **IUpdateService** instances.
- **Count:** An integer count of the items in **List**.

Once initialized, these data elements are not modified.

3.42.2 Timers

None.

3.42.3 Initialization

When the server is created, it SHOULD populate its ADM from persisted update service data obtained from the update agent through an implementation-dependent [**<42>**](#) interface.

3.42.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [**\[MS-RPCE\]**](#) Section [**3**](#).

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Item	Retrieves an item by index. Opnum: 8
NewEnum	Retrieves an enumerator that can be used to enumerate the collection. Opnum: 9
Count	Retrieves a count of the number of items in the collection. Opnum: 10

All methods MUST NOT throw exceptions.

3.42.4.1 IUpdateServiceCollection::Item (Opnum 8)

The **IUpdateServiceCollection::Item (opnum 8)** method retrieves an item from the collection by index.

```
HRESULT Item(
    [in] LONG index,
    [out, retval] IUpdateDownloadContent** retval
);
```

index: The zero-based index of the item to retrieve.

retval: The item at the given *index*.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the *index* is less than 0x00000000 or greater than or equal to the number of items in the collection, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the item at the given *index* in the **List** ADM element.

3.42.4.2 IUpdateServiceCollection::_NewEnum (Opnum 9)

The **IUpdateServiceCollection::_NewEnum (opnum 9)** method retrieves an enumerator over the collection.

```
HRESULT _NewEnum(
    [out, retval] IUnknown** retval
);
```

retval: The **IUnknown** interface of an object that also implements the **IEnumVARIANT** interface, which can be used to enumerate the elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return a newly created object implementing the **IEnumVARIANT** interface, which enumerates the items in the **List** ADM element.

3.42.4.3 IUpdateServiceCollection::Count (Opnum 10)

The **IUpdateServiceCollection::Count (opnum 10)** method retrieves the number of items in the collection.

```
HRESULT Count(
    [out, retval] LONG* retval
);
```

retval: The number of items in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Count** ADM element.

3.42.5 Timer Events

None.

3.42.6 Other Local Events

None.

3.43 IUpdateServiceCollection Client Details

3.43.1 Abstract Data Model

None.

3.43.2 Timers

None.

3.43.3 Initialization

None.

3.43.4 Message Processing Events and Sequencing Rules

To obtain an **IUpdateServiceCollection** instance, a client MUST call the [**IUpdateServiceManager::Services \(opnum 8\)**](#) method.

3.43.5 Timer Events

None.

3.43.6 Other Local Events

None.

3.44 IUpdateServiceManager and IUpdateServiceManager2 Server Details

The **IUpdateServiceManager** interface derives from the **IDispatch** interface and defines methods to manage update services.

The **IUpdateServiceManager2** interface derives from **IUpdateServiceManager** and defines additional methods to manage update services.

3.44.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateServiceManager** server maintains the following data elements:

Services: An **IUpdateServiceCollection** instance containing update services registered with the update agent. Once initialized, this data element is not modified.

ServiceRegisteredWithAU: A string containing the unique identifier of the update service registered with the automatic update agent. Once initialized, this data element is not modified.

AllowedServiceID: A string containing the unique identifier of the only update service that can be registered with the automatic update agent. The string is set to NULL if any update service can be registered with the automatic update agent. This data element can be modified.

AllowWarningUI: A Boolean indicating whether a warning UI is displayed when the service registered with the automatic update agent is changed via this interface. This data element can be modified.

ClientApplicationID: A string identifying the client application that is using this interface. This data element can be modified.

ServiceRegistrations: A collection of update service registrations. Once initialized, this data element is not modified.

3.44.2 Timers

None.

3.44.3 Initialization

When the server is created, it SHOULD populate its ADM as follows:

- **Services:** Set to the collection of update services registered with the update agent. This data is obtained from the update agent through an implementation-dependent[<43>](#) interface.
- **ServiceRegisteredWithAU:** Set to the identifier of the update service currently registered with the automatic update agent. This data is obtained from the update agent through an implementation-dependent[<44>](#) interface.
- **AllowedServiceID:** Set to NULL.
- **AllowWarningUI:** Set to TRUE.
- **ClientApplicationID:** Set to the empty string.
- **ServiceRegistrations:** Set to the collection of update services registered or pending registration with the update agent. This data is obtained from the update agent through an implementation-dependent[<45>](#) interface.

3.44.4 Message Processing Events and Sequencing Rules for IUpdateServiceManager

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
<u>Services</u>	Retrieves a collection of update services registered with the update agent. Opnum: 8
Opnum9NotUsedOnWire	Reserved for local use. Opnum: 9
<u>RegisterServiceWithAU</u>	Registers an update service with the automatic update agent. Opnum: 10
<u>RemoveService</u>	Removes an update service from the update agent. Opnum: 11
Opnum12NotUsedOnWire	Reserved for local use. Opnum: 12

Method	Description
AddScanPackageService	Registers an update service based on a scan package. Opnum: 13
SetOption	Sets options on this interface. Opnum: 14

In the table above, the term "Reserved for local use" means that the client MUST NOT send the opnum, and the server behavior is undefined [\[46\]](#) since it does not affect interoperability.

All methods MUST NOT throw exceptions.

3.44.4.1 IUpdateServiceManager::Services (Opnum 8)

The **IUpdateServiceManager::Services (opnum 8)** method retrieves a collection of update services registered with the update agent.

```
HRESULT Services(
    [out, retval] IUpdateServiceCollection** retval
);
```

retval: A collection of update services registered with the update agent.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Services** ADM element.

3.44.4.2 IUpdateServiceManager::RegisterServiceWithAU (Opnum 10)

The **IUpdateServiceManager::RegisterServiceWithAU (opnum 10)** method registers an update service with the automatic update agent.

```
HRESULT RegisterServiceWithAU(
    [in] BSTR serviceID
);
```

serviceID: A string identifying the update service to register with the automatic update agent.
This service MUST already be registered with the update agent.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD register the given service with the automatic update agent through an implementation-defined interface. This method SHOULD set the **ServiceRegisteredWithAU** ADM element to the given update service identifier.

3.44.4.3 IUpdateServiceManager::RemoveService (Opnum 11)

The **IUpdateServiceManager::RemoveService (opnum 11)** method removes an update service from the update agent.

```
HRESULT RemoveService(
    [in] BSTR serviceID
);
```

serviceID: A string identifying the registered service to remove.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD trigger the update agent to remove the given service through an implementation-defined interface. The method SHOULD remove the given service from the **Services** ADM element.

3.44.4.4 IUpdateServiceManager::AddScanPackageService (Opnum 13)

The **IUpdateServiceManager::AddScanPackageService (opnum 13)** method registers an update service based on a scan package.

```
HRESULT AddScanPackageService(
    [in] BSTR serviceName,
    [in] BSTR scanFileLocation,
    [in, defaultvalue(0)] LONG flags,
    [out, retval] IUpdateService** ppService
);
```

serviceName: The name of the service.

scanFileLocation: The filesystem path of the scan package file.

flags: A bitmask produced from values from the [UpdateServiceOption \(section 2.2.14\)](#) enumeration value.

ppService: An **IUpdateService** instance representing a service based on the scan package.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD trigger the update agent to add a service based on this scan package through an implementation-dependent [<47>](#) interface. This method SHOULD add the given service to the **Services** ADM element and return an IUpdateService instance representing the added service.

3.44.4.5 IUpdateServiceManager::SetOption (Opnum 14)

The **IUpdateServiceManager::SetOption (opnum 14)** method sets options on this interface. The "AllowedServiceID" option restricts the [IUpdateServiceManager::RegisterServiceWithAU \(opnum 10\) \(section 3.44.4.2\)](#) method to work only with the given service ID. The "AllowWarningUI" option controls whether a warning UI is displayed when changing the service registered with the automatic update agent.

```
HRESULT SetOption(
    [in] BSTR optionName,
    [in] VARIANT optionValue
);
```

optionName: MUST be set either to "AllowedServiceID" or "AllowWarningUI".

optionValue: If *optionName* is "AllowedServiceID", the **vt** member MUST be set to VT_BSTR, and the **bstrVal** member MUST contain the identifier of the service to which to restrict the **IUpdateServiceManager::RegisterServiceWithAU (opnum 10)** method.

If *optionName* is "AllowWarningUI", the **vt** member MUST be set to VT_BOOL, and the **boolVal** member MUST be set to VARIANT_TRUE if a warning UI is allowed to be displayed when changing the service registered with the automatic update agent, or VARIANT_FALSE if a warning UI is not allowed to be displayed.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

If *optionName* is "AllowedServiceID", this method SHOULD set the value of the **AllowedServiceID** ADM element to the string stored in *optionValue*. If *optionName* is "AllowWarningUI", this method SHOULD set the value of the **AllowWarningUI** ADM element to the VARIANT_BOOL stored in *optionValue*.

3.44.5 Message Processing Events and Sequencing Rules for IUpdateServiceManager2

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
ClientApplicationID	Retrieves a string identifying the client application that is using this interface. Opnum: 15
ClientApplicationID	Sets a string identifying the client application that is using this interface. Opnum: 16
QueryServiceRegistration	Retrieves the update service registration record for a service. Opnum: 17
AddService2	Registers an update service with the update agent. Opnum: 18

All methods MUST NOT throw exceptions.

3.44.5.1 IUpdateServiceManager2::ClientApplicationID (Opnum 15)

The **IUpdateServiceManager2::ClientApplicationID (opnum 15)** method retrieves a string that identifies the client application that is using this interface.

```
HRESULT ClientApplicationID(
    [out, retval] BSTR* retval
);
```

retval: A string identifying the client application that is using this interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ClientApplicationID** ADM element.

3.44.5.2 IUpdateServiceManager2::ClientApplicationID (Opnum 16)

The **IUpdateServiceManager2::ClientApplicationID (opnum 16)** method sets a string that identifies the client application that is using this interface.

```
HRESULT ClientApplicationID(
    [in] BSTR value
);
```

value: A string that identifies the client application that is using this interface.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD set the **ClientApplicationID** ADM element to the given string.

3.44.5.3 IUpdateServiceManager2::QueryServiceRegistration (Opnum 17)

The **IUpdateServiceManager2::QueryServiceRegistration (opnum 17)** method retrieves the update service registration record for a service.

```
HRESULT QueryServiceRegistration(
    [in] BSTR serviceID,
    [out, retval] IUpdateServiceRegistration** retval
);
```

serviceID: A string identifying an update service.

retval: An [IUpdateServiceRegistration \(section 3.46.4\)](#) instance for the given service.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If no service registration record is found for the given service ID, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the service registration record for the identified service from the **ServiceRegistrations** ADM element.

3.44.5.4 IUpdateServiceManager2::AddService2 (Opnum 18)

The **IUpdateServiceManager2::AddService2 (opnum 18)** method registers an update service with the update agent.

```
HRESULT AddService2(
    [in] BSTR serviceID,
    [in] LONG flags,
    [in] BSTR authorizationCabPath,
    [out, retval] IUpdateServiceRegistration** retval
);
```

serviceID: A string identifying the service.

flags: A bitmask created with values from the [AddServiceFlag \(section 2.2.15\)](#) enumeration specifying options.

authorizationCabPath: The filesystem path of the authorization cabinet file containing information required for a service registration. If this is NULL or the empty string, the server SHOULD search for the authorization cabinet file online when a network connection is available.

retval: An **IUpdateServiceRegistration** instance.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD trigger the update agent to add this update service through an implementation-dependent [`<48>`](#) interface. This method SHOULD add the given service to the **Services** ADM element maintained by the [IUpdateServiceManager \(section 3.44\)](#) interface and return an **IUpdateServiceRegistration** instance that represents the service registration.

3.46 IUpdateServiceRegistration Server Details

The **IUpdateServiceRegistration** interface derives from the **IDispatch** interface and represents an immutable record of a service registration.

3.46.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

An **IUpdateServiceRegistration** server maintains the following data elements:

- **RegistrationState:** A value from the [UpdateServiceRegistrationState \(section 2.2.13\)](#) enumeration that describes the state of the service registration.
- **ServiceID:** A string containing the unique identifier of the update service.
- **IsPendingRegistrationWithAU:** A VARIANT_BOOL that indicates whether the service is pending registration with the automatic update agent.
- **Service:** An **IUpdateService** instance representing the service being registered.

Once initialized, these data elements are not modified.

3.46.2 Timers

None.

3.46.3 Initialization

When the server is created, it SHOULD populate its ADM from persisted service registration data obtained from the update agent through an implementation-dependent[`<49>`](#) interface.

3.46.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) Section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
RegistrationState	Retrieves an enumeration value that describes the state of the service registration. Opnum: 8
ServiceID	Retrieves the service identifier. Opnum: 9
IsPendingRegistrationWithAU	Retrieves whether the service is pending registration with the automatic update agent. Opnum: 10
Service	Retrieves information about the service. Opnum: 11

All methods MUST NOT throw exceptions.

3.46.4.1 IUpdateServiceRegistration::RegistrationState (Opnum 8)

The **IUpdateServiceRegistration::RegistrationState (opnum 8)** method retrieves an enumeration value that describes the state of the service registration.

```
HRESULT RegistrationState(
    [out, retval] UpdateServiceRegistrationState* retval
);
```

retval: A value from the [UpdateServiceRegistrationState \(section 2.2.13\)](#) enumeration that describes the state of the service registration.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **RegistrationState** ADM element.

3.46.4.2 IUpdateServiceRegistration::ServiceID (Opnum 9)

The **IUpdateServiceRegistration::ServiceID (opnum 9)** method retrieves the service identifier.

```
HRESULT ServiceID(
    [out, retval] BSTR* retval
);
```

retval: A string identifying the service.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **ServiceID** ADM element.

3.46.4.3 IUpdateServiceRegistration::IsPendingRegistrationWithAU (Opnum 10)

The **IUpdateServiceRegistration::IsPendingRegistrationWithAU (opnum 10)** method retrieves whether the service is pending registration with the automatic update agent.

```
HRESULT IsPendingRegistrationWithAU(
    [out, retval] VARIANT_BOOL* retval
);
```

retval: MUST be set either to VARIANT_TRUE if the service is pending registration with the automatic update agent or to VARIANT_FALSE if not.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.
- If no service registration record is found for the given service ID, the server MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **IsPendingRegistrationWithAU** ADM element.

3.46.4.4 IUpdateServiceRegistration::Service (Opnum 11)

The **IUpdateServiceRegistration::Service (opnum 11)** method retrieves information about the service.

```
HRESULT Service(
    [out, retval] IUpdateService2** retval
);
```

retval: An **IUpdateService2** instance representing the update service associated with this service registration request.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Service** ADM element.

3.48 IWindowsDriverUpdateEntry Server Details

The **IWindowsDriverUpdateEntry** interface derives from the **IDispatch** interface and represents a device for which a driver is applicable.

3.48.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations

adhere to this model as long as their external behavior is consistent with that described in this document.

The server maintains the following data:

DriverClass: A string specifying the class of the driver.

DriverHardwareID: A string specifying the hardware ID or compatible ID that this driver must match to be installable.

DriverManufacturer: A string containing the language-invariant name of the driver manufacturer.

DriverModel: A string containing the language-invariant model name of the device for which this driver is intended.

DriverProvider: A string containing the language-invariant name of the provider of this driver.

DriverVerDate: A **DATE** ([\[MS-OAUT\]](#) section 2.2.25) structure containing the version date of this driver.

DeviceProblemNumber: A **LONG** specifying the problem number of the device this driver matches.

DeviceStatus: A **LONG** specifying the status of the device this driver matches.

3.48.2 Timers

None.

3.48.3 Initialization

When the server is created, it SHOULD populate its ADM from update metadata obtained from the update agent through an implementation-dependent [**<50>**](#) interface.

3.48.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
DriverClass	Retrieves the class of the driver. Opnum: 8
DriverHardwareID	Retrieves the hardware ID or compatible ID that this driver must match to be installable. Opnum: 9
DriverManufacturer	Retrieves the language-invariant name of the driver manufacturer. Opnum: 10

Method	Description
DriverModel	Retrieves the language-invariant model name of the device for which this driver is intended. Opnum: 11
DriverProvider	Retrieves the language-invariant name of the provider of this driver. Opnum: 12
DriverVerDate	Retrieves the version date of this driver. Opnum: 13
DeviceProblemNumber	Retrieves the problem number of the device this driver matches. Opnum: 14
DeviceStatus	Retrieves the status of the device this driver matches. Opnum: 15

All methods MUST NOT throw exceptions.

3.48.4.1 IWindowsDriverUpdateEntry::DriverClass (Opnum 8)

The **IWindowsDriverUpdateEntry::DriverClass (opnum 8)** method retrieves the class of this driver.

```
HRESULT DriverClass(
    [out, retval] BSTR* retval
);
```

retval: A string specifying the class of this driver.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **DriverClass** ADM element.

3.48.4.2 IWindowsDriverUpdateEntry::DriverHardwareID (Opnum 9)

The **IWindowsDriverUpdateEntry::DriverHardwareID (opnum 9)** method retrieves the hardware ID or compatible ID that this driver must match to be installable.

```
HRESULT DriverHardwareID(
    [out, retval] BSTR* retval
);
```

retval: A string specifying the hardware ID or compatible ID that this driver must match to be installable.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **DriverHardwareID** ADM element.

3.48.4.3 IWindowsDriverUpdateEntry::DriverManufacturer (Opnum 10)

The **IWindowsDriverUpdateEntry::DriverManufacturer (opnum 10)** method retrieves the language-invariant name of the driver manufacturer.

```
HRESULT DriverManufacturer(
    [out, retval] BSTR* retval
);
```

retval: A string containing the language-invariant name of the driver manufacturer.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **DriverManufacturer** ADM element.

3.48.4.4 IWindowsDriverUpdateEntry::DriverModel (Opnum 11)

The **IWindowsDriverUpdateEntry::DriverModel (opnum 11)** method retrieves the language-invariant model name of the device for which this driver is intended.

```
HRESULT DriverModel(
    [out, retval] BSTR* retval
);
```

retval: A string containing the language-invariant model name of the device for which this driver is intended.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.

- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **DriverModel** ADM element.

3.48.4.5 IWindowsDriverUpdateEntry::DriverProvider (Opnum 12)

The **IWindowsDriverUpdateEntry::DriverProvider (opnum 12)** method retrieves the language-invariant name of the provider of this driver.

```
HRESULT DriverProvider(
    [out, retval] BSTR* retval
);
```

retval: A string containing the language-invariant name of the provider of this driver.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **DriverProvider** ADM element.

3.48.4.6 IWindowsDriverUpdateEntry::DriverVerDate (Opnum 13)

The **IWindowsDriverUpdateEntry::DriverVerDate (opnum 13)** method retrieves the version date of the driver.

```
HRESULT DriverVerDate(
    [out, retval] DATE* retval
);
```

retval: A **DATE** ([\[MS-OAUT\]](#) section 2.2.25) structure containing the version date of this driver.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **DriverVerDate** ADM element.

3.48.4.7 IWindowsDriverUpdateEntry::DeviceProblemNumber (Opnum 14)

The **IWindowsDriverUpdateEntry::DeviceProblemNumber (opnum 14)** method retrieves the problem number of the device this driver matches.

```
HRESULT DeviceProblemNumber(
    [out, retval] LONG* retval
);
```

retval: A **LONG** specifying the problem number of the device this driver matches.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **DeviceProblemNumber** ADM element.

3.48.4.8 IWindowsDriverUpdateEntry::DeviceStatus (Opnum 15)

The **IWindowsDriverUpdateEntry::DeviceStatus (opnum 15)** method retrieves the status of the device this driver matches.

```
HRESULT DeviceStatus(
    [out, retval] LONG* retval
);
```

retval: A **LONG** specifying the status of the device this driver matches.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **DeviceStatus** ADM element.

3.50 IWindowsDriverUpdateEntryCollection Server Details

The **IWindowsDriverUpdateEntryCollection** interface derives from the **IDispatch** interface and represents an immutable collection of **IWindowsDriverUpdateEntry** instances.

3.50.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The server maintains the following data elements:

List: An ordered list of **IWindowsDriverUpdateEntry** instances.

Count: An integer, set to the count of the number of items in **List**.

Once initialized, these data elements are not modified.

3.50.2 Timers

None.

3.50.3 Initialization

When the server is created, it SHOULD populate its ADM with update metadata obtained from the update agent through an implementation-dependent [\[51\]](#) interface.

3.50.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
Item	Retrieves an item by index. Opnum: 8
NewEnum	Retrieves an enumerator that can be used to enumerate the collection of IWindowsDriverUpdateEntry instances. Opnum: 9
Count	Retrieves a count of the number of items in the collection. Opnum: 10

All methods MUST NOT throw exceptions.

3.50.4.1 IWindowsDriverUpdateEntryCollection::Item (Opnum 8)

The **IWindowsDriverUpdateEntryCollection::Item (opnum 8)** method retrieves an item by index.

```
HRESULT Item(
    [in] LONG index,
    [out, retval] IWindowsDriverUpdateEntry** retval
);
```

index: The zero-indexed position of the item to retrieve.

retval: The **IWindowsDriverUpdateEntry** instance at the given index.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

If the given index is less than 0x00000000 or greater than or equal to the number of items in the collection, the method MUST return an error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the item in the **List** ADM element at the given index.

3.50.4.2 **IWindowsDriverUpdateEntryCollection:::_NewEnum (Opnum 9)**

The **IWindowsDriverUpdateEntryCollection:::_NewEnum (opnum 9)** method retrieves an enumerator that can be used to enumerate the collection of **IWindowsDriverUpdateEntry** instances.

```
HRESULT _NewEnum(
    [out, retval] IUnknown** retval
);
```

retval: The **IUnknown** interface of an object that implements the **IEnumVARIANT** interface, which can be used to enumerate the elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD create a new object that implements the **IEnumVARIANT** interface and enumerates over the **List** ADM element.

3.50.4.3 **IWindowsDriverUpdateEntryCollection::Count (Opnum 10)**

The **IWindowsDriverUpdateEntryCollection::Count (opnum 10)** method retrieves a count of the number of items in the collection of **IWindowsDriverUpdateEntry** instances.

```
HRESULT Count(
    [out, retval] LONG* retval
);
```

retval: A count of the elements in the collection.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

This method SHOULD return the value of the **Count** ADM element.

3.51 IWindowsDriverUpdateEntryCollection Client Details

3.51.1 Abstract Data Model

None.

3.51.2 Timers

None.

3.51.3 Initialization

None.

3.51.4 Message Processing Events and Sequencing Rules

To retrieve an **IWindowsDriverUpdateEntryCollection** instance, the client MUST call [**IWindowsDriverUpdate4::WindowsDriverUpdateEntries \(opnum 66\) \(section 3.20.12.1\)**](#).

3.51.5 Timer Events

None.

3.51.6 Other Local Events

None.

3.52 IWindowsUpdateAgentInfo Server Details

The **IWindowsUpdateAgentInfo** interface derives from the **IDispatch** interface and provides version information for the server side of the protocol and the update agent.

3.52.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The server does not maintain any data.

3.52.2 Timers

None.

3.52.3 Initialization

None.

3.52.4 Message Processing Events and Sequencing Rules

This protocol MUST indicate to the RPC runtime that it is to perform a strict NDR data consistency check at target level 5.0, as specified in [\[MS-RPCE\]](#) section 3.

This interface includes the following methods:

Methods in RPC Opnum Order

Method	Description
GetInfo	Retrieves version information for the server side of the protocol and the update agent. Opnum: 8

All methods MUST NOT throw exceptions.

3.52.4.1 IWindowsUpdateAgentInfo::GetInfo (Opnum 8)

The **IWindowsUpdateAgentInfo::GetInfo (opnum 8)** method retrieves version information for the server side of the protocol and the update agent.

```
HRESULT GetInfo(
    [in] VARIANT varInfoIdentifier,
    [out, retval] VARIANT* retval
);
```

varInfoIdentifier: A **VARIANT** ([\[MS-OAUT\]](#) section 2.2.29.2) containing a string specifying the type of version information to retrieve. The **vt** member of *varInfoIdentifier* MUST be set to **VT_BSTR**, and the **BSTR** ([\[MS-OAUT\]](#) section 2.2.23) stored in the **bstrVal** member MUST case-insensitively compare equal to one of the following values.

bstrVal value	Information to be retrieved
ApiMajorVersion	The major version number of the server side of the protocol.
ApiMinorVersion	The minor version number of the server side of the protocol.
ProductVersionString	The version of the update agent.

retval: A **VARIANT** containing the requested version information, as specified by the following table.

varInfoIdentifier.bstrVal value	retval
ApiMajorVersion	The vt member MUST be set to VT_I4 . The IVal member SHOULD <52> be set to the server's major version.
ApiMinorVersion	The vt member MUST be set to VT_I4 . The IVal member SHOULD <53> be set to the server's minor version.
ProductVersionString	The vt member MUST be set to VT_BSTR . The bstrVal member SHOULD <54> be set to the version of the update agent.

Return Values: The method MUST return information in an **HRESULT** data structure ([\[MS-ERREF\]](#) section 2.1). The severity bit in the structure identifies the following conditions:

- If the severity bit is set to 0, the method completed successfully.
- If the severity bit is set to 1, the method failed and encountered a fatal error.

Exceptions Thrown: No exceptions are thrown beyond those thrown by the underlying RPC protocol [\[MS-RPCE\]](#).

3.52.5 Timer Events

None.

3.52.6 Other Local Events

None.

3.53 IWindowsUpdateAgentInfo Client Details

3.53.1 Abstract Data Model

None.

3.53.2 Timers

None.

3.53.3 Initialization

None.

3.53.4 Message Processing Events and Sequencing Rules

To obtain an **IWindowsUpdateAgentInfo** instance, a client MUST directly create an object implementing the interface.

3.53.5 Timer Events

None.

3.53.6 Other Local Events

None.

4 Protocol Examples

4.1 Adding a New Update Service

This adding a new update service example shows a sequence of messages used to register a new update service with the update agent.

The client calls the [IUpdateServiceManager2::AddService2 \(opnum 18\) \(section 3.44.5.4\)](#) method on the server, passing in a string that uniquely identifies the update service to be added, as well as a location of the authorization cabinet file for the update service. The server responds with an **IUpdateService** instance representing the added service.

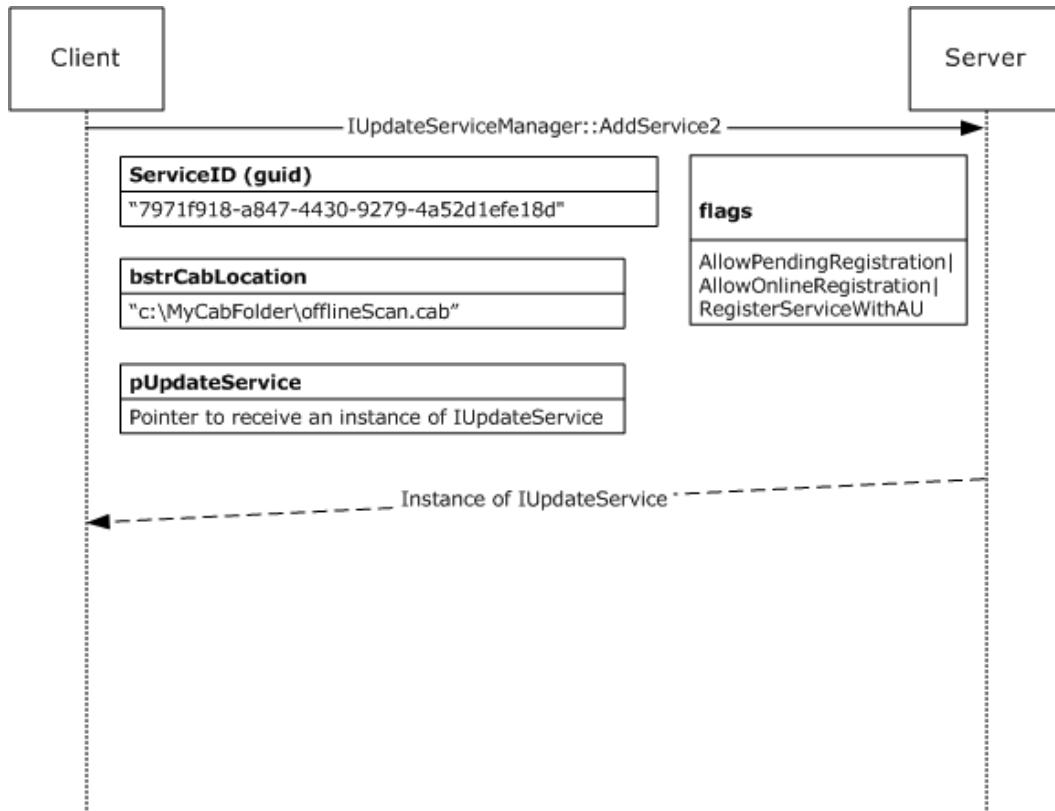

Figure 3: Message sequence diagram for adding an update service

4.2 Adding a New Update Service Based on a Scan Package

This example shows a sequence of messages used to register an update service based on a scan package.

The client calls the [IUpdateServiceManager::AddScanPackageService \(opnum 13\) \(section 3.44.4.4\)](#) method on the server, passing in a name for the resulting service, the location of the scan package cabinet file, and a set of flags controlling the lifetime of the update service. The server responds with an **IUpdateService** instance representing the added scan package service.

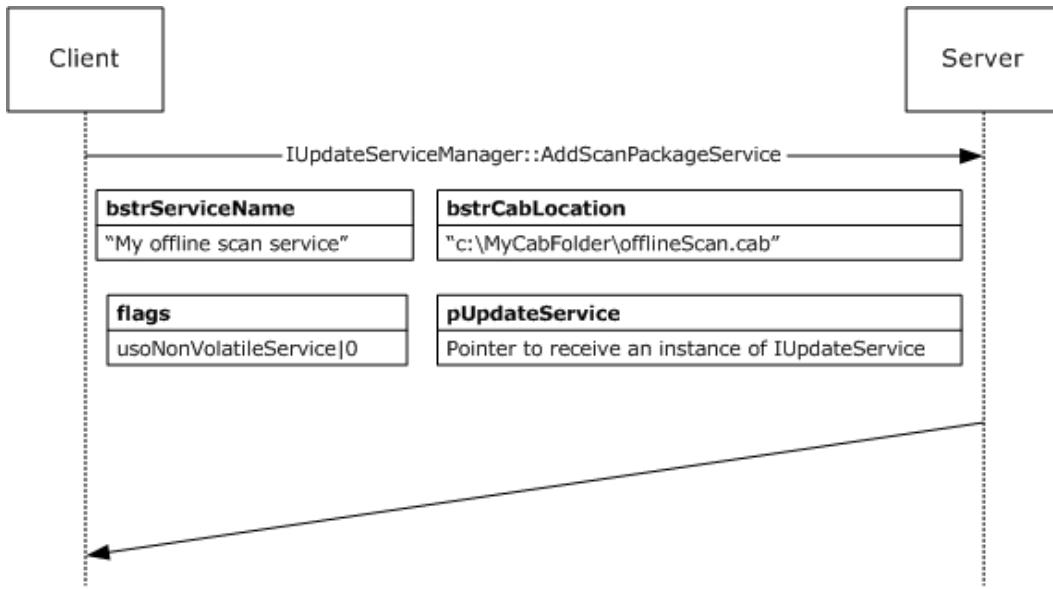

Figure 4: Message sequence diagram for adding an update service based on a scan package

4.3 Performing an Update Search and Consuming Results

This example shows a sequence of messages used to perform an update search and to retrieve the title of the first update found. (This can be generalized to enumerate other properties and to access the remaining updates found.)

1. The client calls the [IUpdateSession::CreateUpdateSearcher \(opnum 13\) \(section 3.16.4.4\)](#) method. The server responds with an **IUpdateSearcher** instance.
2. The client calls the [IUpdateSearcher::ServiceID \(opnum 25\) \(section 3.38.4.16\)](#) method (a put property accessor) and passes the identity of the update service against which the update search is to be invoked.
3. The client calls the [IUpdateSearcher::Search \(opnum 20\) \(section 3.38.4.11\)](#) method with a string describing the set of updates to search for. The server performs the update search and responds with an **ISearchResult** instance.
4. The client calls the [ISearchResult::resultCode \(opnum 8\) \(section 3.14.4.1\)](#) method (a get property accessor). The server responds with a result code indicating the result of the search. For the purposes of this example, assume that the search succeeds.
5. The client calls the [ISearchResult::Updates \(opnum 10\) \(section 3.14.4.3\)](#) method (a get property accessor). The server responds with an **IUpdateCollection** instance containing the updates found during the search. For the purposes of this example, assume that the collection contains one or more updates.
6. The client calls the [IUpdateCollection::Item \(opnum 8\) \(section 3.22.4.1\)](#) method (a get property accessor), passing the index of the desired update within the collection. The server responds with an **IUpdate** instance representing the update desired.
7. The client calls the [IUpdate::Title \(opnum 8\) \(section 3.20.4.1\)](#) method (a get property accessor). The server responds with a string containing the title of the update.

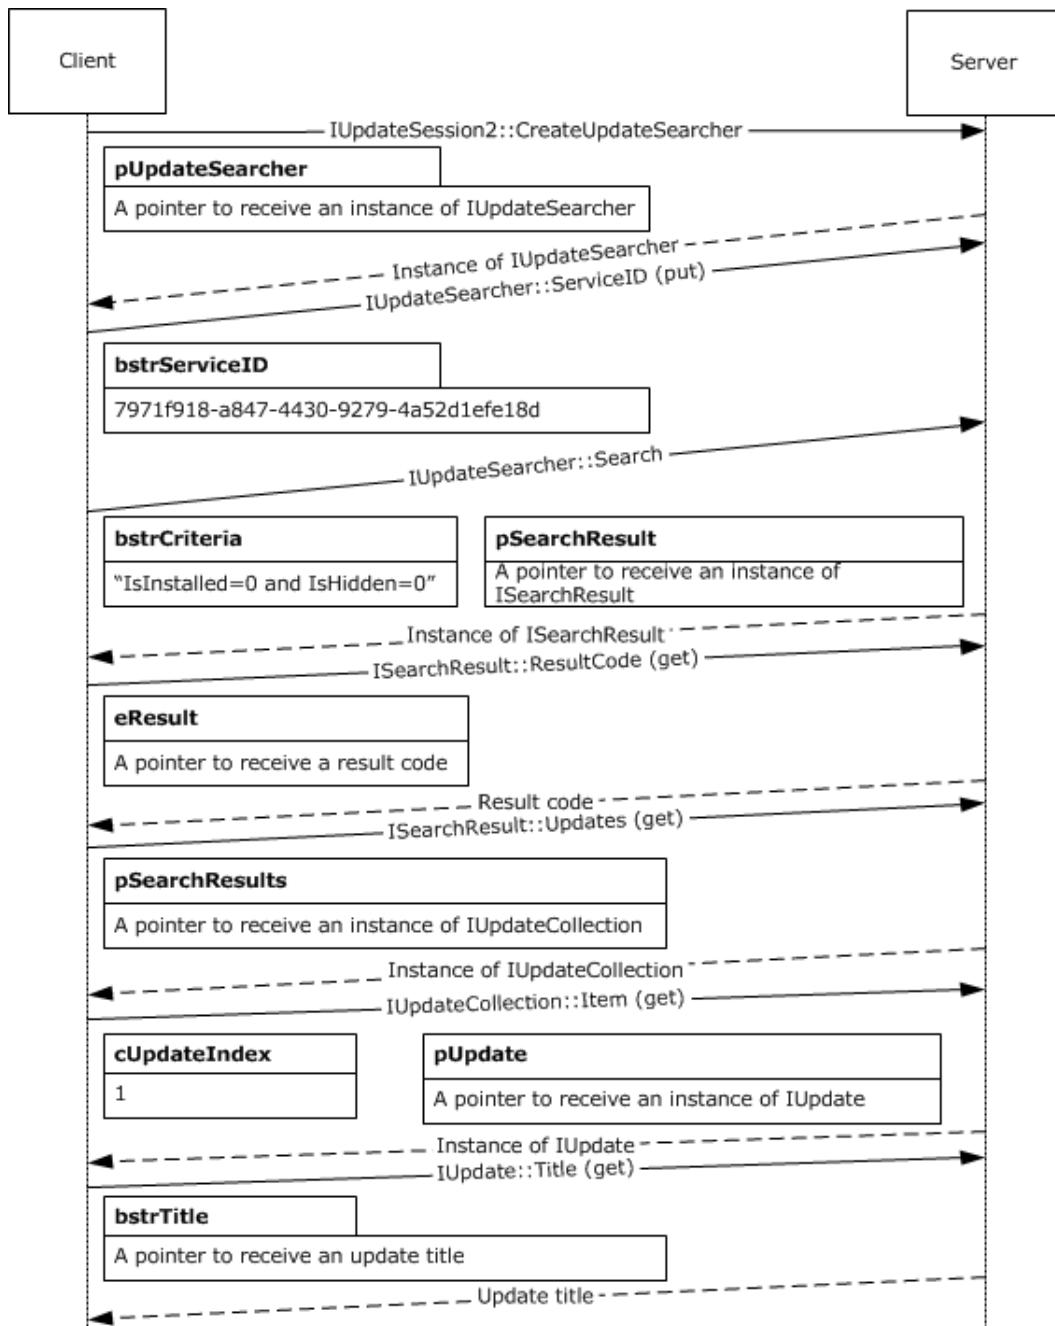

Figure 5: Message sequence diagram for performing an update search and processing search results

5 Security

5.1 Security Considerations for Implementers

The server SHOULD perform access checking to verify that a client is allowed to perform the operation requested.

5.2 Index of Security Parameters

None.

6 Appendix A: Full IDL

For ease of implementation the full IDL is provided below, where "ms-dtyp.idl" refers to the IDL found in [\[MS-DTYP\]](#) Appendix A and "ms-oaut.idl" refers to the IDL found in [\[MS-OAUT\]](#) Appendix A. The syntax uses the IDL syntax extensions defined in [\[MS-RPCE\]](#) sections [2.2.4](#). For example, as noted in [\[MS-RPCE\]](#) section 2.2.4.8, a pointer_default declaration is not required and pointer_default(unique) is assumed.

7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Windows 2000 operating system Service Pack 3 (SP3)
- Windows XP operating system
- Windows Server 2003 operating system
- Windows Vista operating system
- Windows Server 2008 operating system
- Windows 7 operating system
- Windows Server 2008 R2 operating system
- Windows 8 operating system
- Windows Server 2012 operating system
- Windows 8.1 operating system
- Windows Server 2012 R2 operating system

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

[<1> Section 2.2.5:](#) In Windows, the update agent uses BITS to download updates. It maps the update's download priority to the corresponding BITS job priority:

Value	Description
dpLow	BG_JOB_PRIORITY_NORMAL
dpMedium	BG_JOB_PRIORITY_HIGH
dpHigh	BG_JOB_PRIORITY_FOREGROUND
dpExtraHigh	BG_JOB_PRIORITY_FOREGROUND

On Windows 8, Windows Server 2012, Windows 8.1, and Windows Server 2012 R2, if the update's download priority is dpExtraHigh, the corresponding BITS job's BITS_JOB_PROPERTY_HIGH_PERFORMANCE bit is set to TRUE.

[<2> Section 2.2.6:](#) In Windows, the update agent user interface has an option to allow automatic selection of recommended updates.

When the value of the update's AutoSelectionMode is asLetWindowsUpdateDecide, the update agent user interface automatically selects the update if one of the following criteria is met:

- The value of the update's AutoSelectOnWebSites ADM element is VARIANT_TRUE.
- The system administrator has enabled automatic selection of recommended updates and the value of the update's BrowseOnly ADM element is VARIANT_FALSE.
- The system administrator has enabled automatic selection of recommended updates and the value of the update's Type ADM element is utDriver and the value of the update's DeviceProblemNumber ADM element is 1 or 28.

[<3> Section 2.2.7:](#) When the system administrator has enabled automatic download of important updates and the value of the update's AutoDownloadMode ADM element is adLetWindowsUpdateDecide, update agent automatically downloads the update if one of the following criteria is met:

- The value of the update's AutoSelectOnWebSites ADM element is VARIANT_TRUE.
- The system administrator has enabled automatic download of recommended updates and the value of the update's BrowseOnly ADM element is VARIANT_FALSE.
- The system administrator has enabled automatic download of recommended updates, and the value of the update's Type ADM element is utDriver, and the value of the update's DeviceProblemNumber ADM element is 1 or 28.

[<4> Section 3.2.3:](#) In Windows, the update agent writes this data to the registry, and the server obtains this data by reading from the registry.

[<5> Section 3.4.4:](#) Opnums reserved for local use are not used by Windows.

[<6> Section 3.6.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<7> Section 3.6.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<8> Section 3.6.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<9> Section 3.8.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<10> Section 3.8.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<11> Section 3.10.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<12> Section 3.12.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<13> Section 3.14.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<14> Section 3.14.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<15> Section 3.16.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<16> Section 3.16.4:](#) Opnums reserved for local use are not used by Windows.

[<17> Section 3.16.5.1:](#) In Windows, the server uses the GetUserDefaultUILanguage Windows API to obtain the user locale.

[<18> Section 3.17.4:](#) On Windows, the object creation mechanism is the **CoCreateInstance** API function.

[<19> Section 3.18.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain the data. The data obtained and the methods called to obtain it depend on the purpose for which the server is created. For example, if the server is created in response to the [IUpdate::Languages \(Opnum 30\) \(section 3.20.4.22\)](#) method, the server obtains a reference to the language data already stored within the update object's Abstract Data Model. The following table shows the ADM element returned by each method.

Interface method	Creating server's ADM element returned
<u>IStringCollection::Copy (opnum 15) (section 3.18.4.8)</u>	The List ADM element.
<u>IUpdate::Languages (opnum 30) (section 3.20.4.22)</u>	The Languages ADM element.
<u>IUpdate::MoreInfoUrls (opnum 34) (section 3.20.4.26)</u>	The MoreInfoUrls ADM element.
<u>IUpdate::SecurityBulletinIDs (opnum 40) (section 3.20.4.32)</u>	The SecurityBulletinIDs ADM element.
<u>IUpdate::SupersededUpdateIDs (opnum 41) (section 3.20.4.33)</u>	The SupersededUpdateIDs ADM element.

[<20> Section 3.20.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<21> Section 3.20.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<22> Section 3.20.3:](#) In Windows, the server selects the first driver update entry that appears in the update metadata to be the default driver update entry.

[<23> Section 3.20.4:](#) Opnums reserved for local use are not used by Windows.

[<24> Section 3.20.4.27: \[MSFT-MSRC\]](#) rates the enumerated set of values as follows:

Value	Description
Critical	The MSRC rates the fixed issue as "Critical."
Important	The MSRC rates the fixed issue as "Important."
Moderate	The MSRC rates the fixed issue as "Moderate."
Low	The MSRC rates the fixed issue as "Low."

[<25> Section 3.20.5:](#) Opnum 56 is not used by Windows.

[<26> Section 3.20.10:](#)

Opnum	Description
64	Not used by Windows.

[<27> Section 3.22.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<28> Section 3.22.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<29> Section 3.22.4:](#) Opnum 15 is not used by Windows.

[<30> Section 3.24.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<31> Section 3.28.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<32> Section 3.28.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<33> Section 3.30.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<34> Section 3.32.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<35> Section 3.34.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<36> Section 3.36.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<37> Section 3.38.3:](#) In Windows, the locale is passed from the object implementing **IUpdateSession** (or its derived interfaces) to the object implementing **IUpdateSearcher** (or its derived interfaces) via a private method call.

[<38> Section 3.38.3:](#) In Windows, the update agent stores the results of all update installation attempts in a Jet/ESE-based database. The update agent implements a local-only COM interface that provides controlled access to this database, and the server calls methods on this interface to obtain this data.

[<39> Section 3.38.3:](#) In Windows, the update agent stores the results of all update installation attempts in a Jet/ESE-based database. The update agent implements a local-only COM interface that provides controlled access to this database, and the server calls methods on this interface to obtain this data.

[<40> Section 3.38.4:](#) Opnums reserved for local use are not used by Windows.

[<41> Section 3.38.4.11:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to trigger this functionality.

[<42> Section 3.42.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<43> Section 3.44.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<44> Section 3.44.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<45> Section 3.44.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<46> Section 3.44.4:](#) Opnums reserved for local use are not used by Windows.

[<47> Section 3.44.4.4:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to trigger this functionality.

[<48> Section 3.44.5.4:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to trigger this functionality.

[<49> Section 3.46.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<50> Section 3.48.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<51> Section 3.50.3:](#) In Windows, the update agent implements a local-only COM interface, and the server calls methods on this interface to obtain this data.

[<52> Section 3.52.4.1:](#) On Windows 2000, Windows Server 2003, Windows XP, Windows Server 2003 R2, Windows Vista, Windows Server 2008, Windows 7, and Windows Server 2008 R2, the most recent version of the Windows Update Agent returns the value 6. On Windows 8, Windows Server 2012, Windows 8.1, and Windows Server 2012 R2, the most recent version of the Windows Update Agent returns the value 8.

[<53> Section 3.52.4.1:](#) On Windows running the latest Windows Update Agent, the value 0 is returned.

[<54> Section 3.52.4.1:](#) On Windows 2000, Windows Server 2003, Windows XP, Windows Server 2003 R2, Windows Vista, and Windows Server 2008 running the latest Windows Update Agent, the **bstrVal** member is set to "7.4.7600.226". On Windows 7 and Windows Server 2008 R2, the **bstrVal** member is set to "7.3.7600.16385". On Windows 7 SP1 and Windows Server 2008 R2 SP1, the **bstrVal** member is set to "7.5.7601.17514". On Windows 8 and Windows Server 2012, the **bstrVal** member is set to a value beginning with "7.8". On Windows 8.1 and Windows Server 2012 R2, the value begins with "7.9".

8 Change Tracking

This section identifies changes that were made to the [MS-UAMG] protocol document between the January 2013 and August 2013 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- An extensive rewrite, addition, or deletion of major portions of content.
- The removal of a document from the documentation set.
- Changes made for template compliance.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the language and formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical or language changes were introduced. The technical content of the document is identical to the last released version, but minor editorial and formatting changes, as well as updates to the header and footer information, and to the revision summary, may have been made.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.

- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- New content added for template compliance.
- Content updated for template compliance.
- Content removed for template compliance.
- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact protocol@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
7 Appendix B: Product Behavior	Modified this section to include references to Windows 8.1 operating system and Windows Server 2012 R2 operating system.	Y	Content updated.
