Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation (“this documentation”) for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft [Open Specifications Promise](#) or the [Microsoft Community Promise](#). If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting [iplg@microsoft.com](mailto:iplg@microsoft.com).
- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the [Patent Map](#).
- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit [www.microsoft.com/trademarks](http://www.microsoft.com/trademarks).
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights.** All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

**Tools.** The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

**Support.** For questions and support, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).

## Revision Summary

Date	Revision History	Revision Class	Comments
2/14/2008	2.0.1	Editorial	Changed language and formatting in the technical content.
3/14/2008	2.0.2	Editorial	Changed language and formatting in the technical content.
5/16/2008	2.0.3	Editorial	Changed language and formatting in the technical content.
6/20/2008	3.0	Major	Updated and revised the technical content.
7/25/2008	3.0.1	Editorial	Changed language and formatting in the technical content.
8/29/2008	3.0.2	Editorial	Changed language and formatting in the technical content.
10/24/2008	3.0.3	Editorial	Changed language and formatting in the technical content.
12/5/2008	3.1	Minor	Clarified the meaning of the technical content.
1/16/2009	3.1.1	Editorial	Changed language and formatting in the technical content.
2/27/2009	3.1.2	Editorial	Changed language and formatting in the technical content.
4/10/2009	3.1.3	Editorial	Changed language and formatting in the technical content.
5/22/2009	3.1.4	Editorial	Changed language and formatting in the technical content.
7/2/2009	4.0	Major	Updated and revised the technical content.
8/14/2009	4.0.1	Editorial	Changed language and formatting in the technical content.
9/25/2009	4.1	Minor	Clarified the meaning of the technical content.
11/6/2009	5.0	Major	Updated and revised the technical content.
12/18/2009	6.0	Major	Updated and revised the technical content.
1/29/2010	7.0	Major	Updated and revised the technical content.
3/12/2010	7.0.1	Editorial	Changed language and formatting in the technical content.
4/23/2010	7.0.2	Editorial	Changed language and formatting in the technical content.
6/4/2010	7.0.3	Editorial	Changed language and formatting in the technical content.
7/16/2010	7.0.3	None	No changes to the meaning, language, or formatting of the technical content.
8/27/2010	7.0.3	None	No changes to the meaning, language, or formatting of the technical content.
10/8/2010	7.0.3	None	No changes to the meaning, language, or formatting of the technical content.
11/19/2010	7.0.3	None	No changes to the meaning, language, or formatting of the technical content.
1/7/2011	7.0.3	None	No changes to the meaning, language, or formatting of the technical content.
2/11/2011	7.0.3	None	No changes to the meaning, language, or formatting of the technical content.

<b>Date</b>	<b>Revision History</b>	<b>Revision Class</b>	<b>Comments</b>
3/25/2011	7.0.3	None	No changes to the meaning, language, or formatting of the technical content.
5/6/2011	7.0.3	None	No changes to the meaning, language, or formatting of the technical content.
6/17/2011	7.1	Minor	Clarified the meaning of the technical content.
9/23/2011	7.1	None	No changes to the meaning, language, or formatting of the technical content.
12/16/2011	8.0	Major	Updated and revised the technical content.
3/30/2012	9.0	Major	Updated and revised the technical content.
7/12/2012	9.0	None	No changes to the meaning, language, or formatting of the technical content.
10/25/2012	9.0	None	No changes to the meaning, language, or formatting of the technical content.
1/31/2013	9.0	None	No changes to the meaning, language, or formatting of the technical content.
8/8/2013	9.1	Minor	Clarified the meaning of the technical content.
11/14/2013	9.1	None	No changes to the meaning, language, or formatting of the technical content.
2/13/2014	10.0	Major	Updated and revised the technical content.
5/15/2014	10.0	None	No changes to the meaning, language, or formatting of the technical content.
6/30/2015	11.0	Major	Significantly changed the technical content.
10/16/2015	11.0	None	No changes to the meaning, language, or formatting of the technical content.
7/14/2016	11.1	Minor	Clarified the meaning of the technical content.
6/1/2017	11.1	None	No changes to the meaning, language, or formatting of the technical content.
9/15/2017	12.0	Major	Significantly changed the technical content.
9/12/2018	13.0	Major	Significantly changed the technical content.

# 1 Introduction

This document is a companion reference to the protocol specifications. It describes how Unicode strings are compared in Windows protocols and how Windows supports Unicode conversion to earlier codepages. For example:

- UTF-16 string comparison: Provides linguistic-specific comparisons between two Unicode strings and provides the comparison result based on the language and region for a specific user.
- Mapping of UTF-16 strings to earlier ANSI codepages: Converts Unicode strings to strings in the earlier codepages that are used in older versions of Windows and the applications that are written for these earlier codepages.

## 1.1 Glossary

This document uses the following terms:

**code page:** An ordered set of characters of a specific script in which a numerical index (code-point value) is associated with each character. Code pages are a means of providing support for character sets and keyboard layouts used in different countries. Devices such as the display and keyboard can be configured to use a specific code page and to switch from one code page (such as the United States) to another (such as Portugal) at the user's request.

**double-byte character set (DBCS):** A character set that can use more than one byte to represent a single character. A DBCS includes some characters that consist of 1 byte and some characters that consist of 2 bytes. Languages such as Chinese, Japanese, and Korean use DBCS.

**IDNA2003:** The IDNA2003 specification is defined by a cluster of IETF RFCs: IDNA [RFC3490], Nameprep [RFC3491], Punycode [RFC3492], and Stringprep [RFC3454].

**IDNA2008:** The IDNA2008 specification is defined by a cluster of IETF RFCs: Internationalized Domain Names for Applications (IDNA): Definitions and Document Framework [RFC5890], Internationalized Domain Names in Applications (IDNA) Protocol [RFC5891], The Unicode Code Points and Internationalized Domain Names for Applications (IDNA) [RFC5892], and Right-to-Left Scripts for Internationalized Domain Names for Applications (IDNA) [RFC5893]. There is also an informative document: Internationalized Domain Names for Applications (IDNA): Background, Explanation, and Rationale [RFC5894].

**IDNA2008+UTS46:** The IDNA2008+UTS46 citation refers to operations that comply with both the and the Unicode IDNA Compatibility Processing [TR46] specifications.

**single-byte character set (SBCS):** A character encoding in which each character is represented by one byte. Single-byte character sets are limited to 256 characters.

**sort key:** Numerical representations of a sort element based on locale-specific sorting rules. A sort key consists of several weighted components that represent a character's script, diacritics, case, and additional treatment based on locale.

**Unicode:** A character encoding standard developed by the Unicode Consortium that represents almost all of the written languages of the world. The Unicode standard [UNICODE5.0.0/2007] provides three forms (UTF-8, UTF-16, and UTF-32) and seven schemes (UTF-8, UTF-16, UTF-16 BE, UTF-16 LE, UTF-32, UTF-32 LE, and UTF-32 BE).

**UTF-16:** A standard for encoding Unicode characters, defined in the Unicode standard, in which the most commonly used characters are defined as double-byte characters. Unless specified otherwise, this term refers to the UTF-16 encoding form specified in [UNICODE5.0.0/2007] section 3.9.

**MAY, SHOULD, MUST, SHOULD NOT, MUST NOT:** These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

## 1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

### 1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

### 1.2.2 Informative References

None.

### 1.3 Overview

This document describes the following protocols when dealing with Unicode strings on the Windows platform:

- UTF-16 string comparison: This string comparison is used to provide a linguistic-specific comparison between two Unicode strings. This scenario provides a string comparison result based on the expectations of users from different languages and different regions.
- The mapping of UTF-16 strings to earlier codepages: This scenario is used to convert between Unicode strings and strings in the earlier codepage, which are used by older versions of Windows and applications written for these earlier codepages.

### 1.4 Applicability Statement

This reference document is applicable as follows:

- To perform UTF-16 character comparisons in the same manner as Windows. This document only specifies a subset of Windows behaviors that are used by other protocols. It does not document those Windows behaviors that are not used by other protocols.
- To provide the capability to map between UTF-16 strings and earlier codepages in the same manner as Windows.

### 1.5 Standards Assignments

The following standards assignments are used by the Windows Protocols Unicode Reference.

Parameter	Value	Reference
Codepage Data File (section 2.2.2)	<b>Various</b>	[UNICODE-BESTFIT]

## 2 Messages

The following sections specify how Windows Protocols Unicode Reference messages are transported and Windows Protocols Unicode Reference message syntax.

### 2.1 Transport

### 2.2 Message Syntax

#### 2.2.1 Supported Codepage in Windows

Windows assigns an integer, called code page ID, to every supported codepage.

Based on the usage, the codepage supported in Windows can be categorized in the following:

- ANSI codepage

Windows codepages are also sometimes referred to as active codepages or system active codepages. Windows always has one currently active Windows codepage. All ANSI Windows functions use the currently active codepage.

The usual ANSI codepage ID for US English is codepage 1252.

Windows codepage 1252, the codepage commonly used for English and other Western European languages, was based on an American National Standards Institute (ANSI) draft. That draft eventually became ISO 8859-1, but Windows codepage 1252 was implemented before the standard became final, and is not exactly the same as ISO 8859-1.

- OEM codepage

- Extended codepage

These codepages cannot be used as ANSI codepages, or OEM codepages. Windows can support conversions between Unicode and these codepages. These codepages are generally used for information exchange purpose with international/national standard or legacy systems. Examples are UTF-8, UTF-7, EBCDIC, and Macintosh codepages.

The following table shows all the supported codepages by Windows. The Codepage ID lists the integer number assigned to a codepage. ANSI/OEM codepages are in bold face. The Codepage Description column describes the codepage. The Codepage notes column lists the category of a codepage and the relevant protocol section in this document to find protocol information.

<b>Codepage ID</b>	<b>Codepage descriptions</b>	<b>Codepage notes</b>
37	IBM EBCDIC US-Canada	Extended codepage; for processing rules, see section 3.1.5.1.1.

## 2.2.2 Supported Codepage Data Files

The mapping of UTF-16 strings to codepages relies on codepage data files to provide conversion data. These codepage data files map Unicode characters to characters in a single-byte character set (SBCS) or double-byte character set (DBCS).

The data files of supported system codepages are published as specified in [CODEPAGEFILES], [UNICODE], and [UNICODE-BESTFIT]. The location identification uses a simple file-naming convention, which is bestfitxxxx.txt, where xxxx is the codepage number. For example, bestfit950.txt contains the data for codepage 950, and bestfit1252.txt contains the data for codepage 1252.

The pseudocode assumes all these codepage files are available.

### 2.2.2.1 Codepage Data File Format

The Readme.txt (as specified in [UNICODE-README]) provides details about the codepages files and the file format. This section specifies information about the pseudocode of mapping UTF-16 strings to earlier codepages by taking the content from the Readme.txt.

Each file has sections of keyword tags and records. Any text after ";" is ignored as blank lines. Fields are delimited by one or more space or tab characters. Each section begins with one of the following tags:

- CODEPAGE ([UNICODE-README])
- CPINFO ([UNICODE-README])
- MBTABLE (section 2.2.2.1.2)
- WCTABLE (section 2.2.2.1.1)
- DBCSRANGE (section 2.2.2.1.3) (DBCS codepages only)
- DBCSTABLE (section 2.2.2.1.3) (DBCS codepages only)

### 2.2.2.1.1 WCTABLE

The WCTABLE tag marks the start of the mapping from Unicode UTF-16 to MultiByte bytes. It has one field.

Field 1: The number of records of Unicode to byte mappings. Note that this field is often more than the number of roundtrip mappings that are supported by the codepage due to Windows best-fit behavior.

An example of the WCTABLE tag is:

```
WCTABLE 698
```

The Unicode UTF-16 mapping records follow the WCTABLE section. These mapping records are in two forms: single-byte or double-byte codepages. Both forms have two fields.

Field 1: The Unicode UTF-16 code point for the character being converted.

Field 2: The single byte that this UTF-16 code point maps to. This can be a best-fit mapping.

The following example shows Unicode to byte-mapping records for SBCSs.

```
0x0000 0x00; Null
0x0001 0x01; Start Of Heading
...
0x0061 0x61; Latin Small Letter A
0x0062 0x62; Latin Small Letter B
0x0063 0x63; Latin Small Letter C
...
0x221e 0x38; Infinity << Best Fit Mapping
...
0xff41 0x61; Fullwidth Latin Small Letter A << Best Fit Mapping
0xff42 0x62; Fullwidth Latin Small Letter B << Best Fit Mapping
0xff43 0x63; Fullwidth Latin Small Letter C << Best Fit Mapping
...
```

Field 1: The Unicode UTF-16 code point for the character being converted.

Field 2: The byte or bytes that this code point maps to as a 16-bit value. The high byte is the lead byte, and the low byte is the trail byte. If the high byte is 0, this is a single-byte code point with the value of the low byte and no lead byte is emitted.

The following example shows Unicode to byte-mapping records for DBCSs.

```

0x0000 0x0000; Null
0x0001 0x0001; Start Of Heading
...
0x0061 0x0061; a
0x0062 0x0062; b
0x0063 0x0063; c
...
0x221e 0x8187; Infinity
...
0xff41 0x8281; Fullwidth a
0xff42 0x8282; Fullwidth b
0xff43 0x8283; Fullwidth c
...

```

### 2.2.2.1.2 MBTABLE

The MBTABLE tag marks the start of the mapping from single-byte bytes to Unicode UTF-16. It has one field.

Field 1: The number of records of single-byte to Unicode mappings.

An example of the MBTABLE tag is:

```

MBTABLE 196

```

The Unicode UTF-16 mapping records follow the MBTABLE section. These mapping records have two fields.

Field 1: The single byte character of the codepage.

Field 2: The Unicode UTF-16 code point that the codepage character maps to.

The following example shows mapping records for codepage 932.

```

0x00 0x0000; Null
0x01 0x0001; Start Of Heading
0x02 0x0002; Start Of Text
0x03 0x0003; End Of Text
0x04 0x0004; End Of Transmission
0x05 0x0005; Enquiry
0x06 0x0006; Acknowledge
0x07 0x0007; Bell
0x08 0x0008; Backspace
...
0xa1 0xff61; Halfwidth Ideographic Period
0xa2 0xff62; Halfwidth Opening Corner Bracket
0xa3 0xff63; Halfwidth Closing Corner Bracket
0xa4 0xff64; Halfwidth Ideographic Comma
0xa5 0xff65; Halfwidth Katakana Middle Dot
0xa6 0xff66; Halfwidth Katakana Wo
0xa7 0xff67; Halfwidth Katakana Small A
0xa8 0xff68; Halfwidth Katakana Small I
0xa9 0xff69; Halfwidth Katakana Small U
0xaa 0xff6a; Halfwidth Katakana Small E
0xab 0xff6b; Halfwidth Katakana Small O
0xac 0xff6c; Halfwidth Katakana Small Ya

```

### 2.2.2.1.3 DBCSRANGE

The DBCSRANGE tag marks the start of the mapping from double-byte bytes to Unicode UTF-16. It has one field.

Field 1: The number of records of lead byte ranges.

An example of the DBCSRANGE tag is:

```
DBCSRANGE 2
```

The Lead Byte Range records follow the DBCSRANGE section. These mapping records have two fields.

Field 1: The start of lead byte range.

Field 2: The end of lead byte range.

The following example shows one of the Lead Byte Range records for codepage 932. In this codepage, it has one range of lead byte, starting from 0x81 (decimal 129) to 0x9f (decimal 159). So there are 31 lead bytes in this example (159 - 129 + 1). Each lead byte will have a corresponding DBCSRANGE.

```
0x81 0x9f; Lead Byte Range
```

A group of DBCSTABLE sections follows the lead-byte range record. Each lead byte will have a corresponding DBCSTABLE section. In each DBCSTABLE section, it has one field.

Field 1: This field is the number of trail byte mappings for the lead byte.

The lead byte of the first DBCSTABLE is the first lead byte of the previous Lead Byte Range record. Each subsequent DBCSTABLE is for the next consecutive lead byte value.

The following example shows the first DBCSTABLE for codepage 932. This is for lead byte 0x81.

```
DBCSTABLE 147; LeadByte = 0x81
```

The DBCSTABLE record describes the mappings available for a particular lead byte. The comment is ignored but descriptive.

Field 1: This field is the trail byte to map from.

Field 2: This field is the Unicode UTF-16 code point that this lead byte/trail byte combination map to.

The following example shows DBCSTABLE records for codepage 932 for lead byte 0x81.

```
0x40 0x3000; Ideographic Space  
0x41 0x3001; Ideographic Comma  
...
```

## 3 Protocol Details

The following sections specify details of the Windows Protocols Unicode Reference, including abstract data models and message processing rules.

### 3.1 Client Details

#### 3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with what is described in this document.

No abstract data model is needed.

#### 3.1.2 Timers

None.

#### 3.1.3 Initialization

None.

#### 3.1.4 Higher-Layer Triggered Events

None.

#### 3.1.5 Message Processing Events and Sequencing Rules

##### 3.1.5.1 Mapping Between UTF-16 Strings and Legacy Codepages

###### 3.1.5.1.1 Mapping Between UTF-16 Strings and Legacy Codepages Using CodePage Data File

This process maps between a Unicode string that is encoded in UTF-16 and a string in a specified codepage by using a codepage data file specified in 2.2.2.1.

###### 3.1.5.1.1.1 Pseudocode for Accessing a Record in the Codepage Data File

This section contains the pseudocode that is used to read information from the codepage file. The following example is taken from codepage data file 950.txt.

OPEN SECTION indicates that queries for records in a specific section are made. To open the following section with the WCTABLE label, the following syntax is used. The OPEN SECTION is accessible by using the WideCharMapping name.

```
OPEN SECTION WideCharMapping
  where section name is WCTABLE from bestfit950.txt
```

SELECT RECORD assigns a line from the data file to be referenced by the assigned variable name. For example, the following code selects a record from the WideCharMapping section, and the record is accessible by using the MappingData name.

```
SET UnicodeChar to 0x4e00
SELECT RECORD MappingData from WideCharMapping
  where field 1 matches UnicodeChar
```

The following example selects the line.

```
0x4e00 0xa440
```

Values from selected records are referenced by field number. The following example selects the individual data fields from the selected row.

```
SET MultiByteResult to MappingData.Field2
```

In this example, the value of MultiByteResult is the hexadecimal value 0xa440.

```
CODEPAGE 950           ; Chinese (Taiwan, Hong Kong SAR) - ANSI, OEM
CPINFO 2 0x3f 0x003f   ; DBCS CP, Default Char = Question Mark
...
WCTABLE 20321
0x0000 0x0000; Null
0x0001 0x0001; Start Of Heading
0x0002 0x0002; Start Of Text
0x0003 0x0003; End Of Text
0x0004 0x0004; End Of Transmission
0x0005 0x0005; Enquiry
...
0x4e00 0xa440
0x4e01 0xa442
0x4e03 0xa443
0x4e07 0xc94
```

### 3.1.5.1.1.2 Pseudocode for Mapping a UTF-16 String to a Codepage String

COMMENT This algorithm maps a Unicode string encoded in UTF-16 to a string in the specified ANSI codepage. The supported ANSI codepages are limited to those that can be set as system codepage.

It requires the following externally specified values:

1) CodePage: An integer value to represent an ANSI codepage value.

If CodePage value is CP\_ACP (0), use the system default ANSI codepage from the OS.

If CodePage value is CP\_OEMCP (1), use the system default OEM codepage from the OS.

2) UnicodeString: A string encoded in UTF-16. Every Unicode code point is an unsigned 16-bit ("WORD") value. A surrogate pair is not supported in this algorithm.

3) UnicodeStringLength: The string length in 16-bit ("WORD") unit for UnicodeString. When UnicodeStringLength is 0, the length is

decided by counting from the beginning of the string to a NULL character (Unicode value U+0000), including the null character.

- 4) MultiByteString: A string encoded in ANSI codepage. Every character can be an 8-bit (byte) unsigned value or two 8-bit unsigned values.
- 5) MultiByteStringLength: The length in bytes, including the byte for NULL terminator. When MultiByteStringLength is 0, the MultiByteString value will not be used in this algorithm. Instead, the length of the result string in ANSI codepage will be returned.
- 6) lpDefaultChar  
Optional. Point to the byte to use if a character cannot be represented in the specified codepage. The application sets this parameter to NULL if the function is to use a system default value. The common default value is 0x3f, which is the ASCII value for the question mark.

#### PROCEDURE WideCharToMultiByteFromCodepageDataFile

```
IF CodePage is CP_ACP THEN
    COMMENT Windows operating system keeps a systemwide value of
        default ANSI system codepage. It is used to provide a default
    COMMENT system codepage to be used by legacy ANSI application.

    SET CodePage to the default ANSI system codepage from the Windows
        operating system.
ELSE IF CodePage is CP_OEMCP THEN
    COMMENT Windows keeps a systemwide value of
        default OEM system codepage. It is used to provide a default
    COMMENT system codepage to be used by legacy console application.

    SET CodePage to the default OEM system codepage from Windows.

ENDIF

IF UnicodeStringLength is 0 THEN
    COMPUTE UnicodeStringLength as the string length in 16-bit units
        of UnicodeString as a NULL-terminated string, including
        NULL terminator.
ENDIF

IF MultiByteStringLength is 0 THEN
    SET IsCountingOnly to True
ELSE
    SET IsCountingOnly to False
ENDIF

SET ResultMultiByteLength to 0
SET CodePageFileName to the concatenation of strings "Bestfit",
    CodePage as a string, and ".txt"

IF lpDefaultChar is null THEN
    COMMENT No default char is specified by the caller. Read the default
    COMMENT char from CPINFO in the data file

    OPEN SECTION CharacterInfo where section name is CPINFO
        from file with the name of CodePageFileName
    SET lpDefaultChar to CharacterInfo.Field3
ENDIF

OPEN SECTION WideCharMapping where section name is WCTABLE from file
    with the name of CodePageFileName

FOR each Unicode codepoint UnicodeChar in UnicodeString
    SELECT MappingData from WideCharMapping
```

```

        where field 1 matches UnicodeChar

### 3.1.5.1.1.3 Pseudocode for Mapping a Codepage String to a UTF-16 String

COMMENT This algorithm maps a Unicode string encoded in the specified codepage to UTF-16.

It requires the following externally specified values:

- 1) CodePage: An integer value to represent an ANSI codepage value.

If CodePage value is CP\_ACP (0), use the system default ANSI codepage from the OS.

If CodePage value is CP\_OEMCP (1), use the system default OEM codepage from the OS.2) MultiByteString: A string encoded in ANSI codepage. Every character can be an 8-bit (byte) unsigned value or two 8-bit unsigned values.

- 3) MultiByteStringLength: The length in bytes, including the byte for terminating null character. When MultiByteStringLength is 0, the length is decided by counting from the beginning of the string to a null character (0x00), including the null character.
- 4) UnicodeString: A string encoded in UTF-16. Every Unicode code point is an unsigned 16-bit ("WORD") value. Surrogate pair is not supported in this algorithm.
- 5) UnicodeStringLength: The string length in 16-bit ("WORD") unit for UnicodeString. When UnicodeStringLength is 0,

the UnicodeString value will not be used in this algorithm.  
Instead, the length of the result string in UTF-16 will be  
returned.

```
PROCEDURE MultiByteToWideCharFromCodepageDataFile

IF CodePage is CP_ACP THEN
    COMMENT Windows keeps a systemwide value of
        default ANSI system codepage. It is used to provide a default
    COMMENT system codepage to be used by legacy ANSI application.

### 3.1.5.1.2 Mapping Between UTF-16 Strings and ISO 2022-Based Codepages

[ECMA-035] defines the standard that is fully identical with International Standard ISO/IEC 2022:1994. EUC (Extended Unix Code) is based on ISO-2022 standard.

For more information, see [ECMA-035].

### 3.1.5.1.3 Mapping between UTF-16 Strings and GB 18030 Codepage

Windows implements GB-18030 based on [GB18030].

For more information, please see [GB18030].

### 3.1.5.1.4 Mapping Between UTF-16 Strings and ISCII Codepage

Windows implements ISCII-based codepage based on [ISCII].

For more information, see [ISCII].

### 3.1.5.1.5 Mapping Between UTF-16 Strings and UTF-7

Windows implements UTF-7 codepage based on [RFC2152].

For more information, see [RFC2152].

### 3.1.5.1.6 Mapping Between UTF-16 Strings and UTF-8

Windows implements UTF-8 codepage based on [UNICODE5.0.0/CH3].

For more information, see [UNICODE5.0.0/CH3].

## 3.1.5.2 Comparing UTF-16 Strings by Using Sort Keys

To compare strings, a sort key is required for each string. A binary comparison of the sort keys can then be used to arrange the strings in any order.

### 3.1.5.2.1 Pseudocode for Comparing UTF-16 Strings

This algorithm compares two UTF-16 strings by using linguistically appropriate rules.

```

This algorithm compares two Unicode strings using linguistic
appropriate rules. It requires the following externally specified

```

```

values:

    1) StringA: A string encoded in UTF-16
    2) StringB: A string encoded in UTF-16

CALL GetWindowsSortKey
    WITH StringA
    RETURNING SortKeyA
CALL GetWindowsSortKey
    WITH StringB
    RETURNING SortKeyB

CALL CompareSortKeys
    WITH SortKeyA, SortKeyB
    RETURNING Result

IF Result is "SortKeyA is equal to SortKeyB" THEN
    StringA is considered equal to StringB
ELSE IF Result is "SortKeyA is less than SortKeyB" THEN
    StringA is sorted prior to StringB
ELSE
    StringA is sorted after StringB
ENDIF

```

### 3.1.5.2.2 CompareSortKey

This algorithm generates sort keys for two strings and uses the sort keys to provide a linguistically appropriate string comparison.

```

COMMENT CompareSortKeys
COMMENT On Entry: SortKeyA - An array of bytes returned from
COMMENT                               GetWindowsSortKey
COMMENT                               SortKeyB - An array of bytes returned from
COMMENT                               GetWindowsSortKey
COMMENT
COMMENT On Exit: Result - A value indicating if SortKeyA
COMMENT                               is less than, equal to, or greater
COMMENT                               than SortKeyB

PROCEDURE CompareSortKeys

SET index to 0
WHILE index is less than Length(SortKeyA) and
    index is also less than Length(SortKeyB)

    IF SortKeyA[index] is less than SortKeyB[index] THEN
        SET Result to "SortKeyA is less than SortKeyB"
        RETURN
    ENDIF
    IF SortKeyA[index] is greater than SortKeyB[index] THEN
        SET Result to "SortKeyA is greater than SortKeyB"
        RETURN
    ENDIF

INCREMENT index
ENDWHILE

IF Length(SortKeyA) is equal to Length(SortKeyB) THEN
    SET Result to "SortKeyA is equal to SortKeyB"
ELSE IF Length(SortKeyA) is less than Length(SortKeyB) THEN
    SET Result to "SortKeyA is less than SortKeyB"
ELSE
    assert Length(SortKeyA) needs to be greater than Length(SortKeyB)
    SET Result to "SortKeyA is greater than SortKeyB"
ENDIF
RETURN

```

Any sorting mechanism can be used to arrange these strings by comparing their sort keys.

### 3.1.5.2.3 Accessing the Windows Sorting Weight Table

Windows gets its sorting data from a data table (see section 3.1.5.2.3.1). Code points are labeled by using UTF-16 values. The file is arranged in sections of tab-delimited field records. Optional comments begin with a semicolon. Each section contains a label and can have a subsection label.<1>

Note that labels are any field that does not begin with a numerical (0xNNNN) value. Blank lines and characters that follow a ";" are ignored.

This document uses the following notation to specify the processing of the file.

OPEN indicates that queries are made for records in a specific section. To open the preceding section with the SORTKEY label and DEFAULT sublabel, the following syntax is used. The OPEN SECTION is accessible by using the DefaultTable name.

```
OPEN SECTION DefaultTable where name is
    SORTKEY\DEFAULT from unisort.txt
```

SELECT assigns a line from the data file to be referenced by the assigned variable name. To select the highlighted row preceding, this document uses this notation. The selected row is accessible by using the name CharacterRow.

```
SET UnicodeChar to 0x0041
SELECT RECORD CharacterRow FROM DefaultTable
    WHERE field 1 matches UnicodeChar
```

Values from selected records are referenced by field number. The following pseudo code selects the individual data fields from the selected row.

```
SET CharacterWeight.ScriptMember to CharacterRow.Field2
SET CharacterWeight.PrimaryWeight to CharacterRow.Field3
SET CharacterWeight.DiacriticWeight to CharacterRow.Field4
SET CharacterWeight.CaseWeight to CharacterRow.Field5
```

To select the record for characters 0x0043 and 0x0068 with LCID 0x0405, the following notation is used.<2>

```
SET Character1 to 0x0043
SET Character2 to 0x0068
SET SortLocale to 0x0405

OPEN SECTION ContractionTable where name is
    SORTTABLES\COMPRESSION\LCID[SortLocale]\TWO from unisort.txt
SELECT RECORD ContractionRow FROM ContractionTable WHERE field 1
    matches Character1 and field 2 matches Character2
SET CharacterWeight.ScriptMember to ContractionRow.Field3
SET CharacterWeight.PrimaryWeight to ContractionRow.Field4
SET CharacterWeight.DiacriticWeight to ContractionRow.Field5
SET CharacterWeight.CaseWeight to ContractionRow.Field6
```

### 3.1.5.2.3.1 Windows Sorting Weight Table

This section contains a link to detailed character weight specifications that permit consistent sorting and comparison of Unicode strings. The data is not used by itself but is used as one of the inputs to the comparison algorithm. The layout and format of data in this file is also specified in [MSDN-SWT].<3>

### 3.1.5.2.4 GetWindowsSortKey Pseudocode

This algorithm specifies the generation of sort keys for a specific UTF-16 string.

### 3.1.5.2.5 TestHungarianCharacterSequences

This algorithm checks if the specified UTF-16 string has a Hungarian special-character sequence for the specified locale in the specific string index.

Hungarian contains special character sequences in which the first character of the string designates a string that is equivalent to the last three characters of the string. For example, the string "dzds" is actually treated as the string "dzsdzs" for the purposes of generating the sort key. This function checks to see if the specified locale is Hungarian, and it also checks to see if the next two characters starting in the specified index are the same. If so, this indicates that it is a likely Hungarian special-character sequence.

### 3.1.5.2.6 GetContractionType

This algorithm specifies the checking of the type of contraction based on the character weight. Contraction is defined by [UNICODE-COLLATION] section 3.2.

For instance, "ll" acts as a single unit in Spanish so that it comes between l and m. This is a two-character contraction. Similarly, "dzs" acts as a single unit in Hungarian, so it is a three-character contraction.

These functions specify if the weights will not be at the beginning of a contraction, the beginning of a two-character contraction, or the beginning of a three-character contraction.

### 3.1.5.3 Mapping UTF-16 Strings to Upper Case

To map a UTF-16 string to upper case, each UTF-16 code point is looked for in an upper casing table [MSDN-UCMT/Win8]. If an entry is found, the input code point is changed to the output code point.

#### 3.1.5.3.1 ToUpperCase

This algorithm converts a UTF-16 string to its upper case form.

```

COMMENT ToUpperCase
COMMENT On Entry: inputString - A string encoded in UTF-16
COMMENT
COMMENT On Exit: Result - A string encoded in UTF-16 with
COMMENT the output in Upper Case form.

PROCEDURE ToUpperCase

SET Result to empty string

SET index to 0
WHILE index is less than Length(inputString)
    SET upperCase to UpperCaseMapping(inputString[index])
    APPEND upperCase to Result
INCREMENT index
ENDWHILE

RETURN

```

#### 3.1.5.3.2 UpperCaseMapping

This algorithm converts a UTF-16 code point to its upper case form using the UpperCaseTable in [MSDN-UCMT/Win8].

```

COMMENT UpperCaseMapping
COMMENT On Entry: SourceCharacter - A UTF-16 code point
COMMENT
COMMENT On Exit: Result - Upper case UTF-16 code point

PROCEDURE UpperCaseMapping

```

```

SELECT RECORD caseMapping FROM UpperCaseTable WHERE field 1
    matches SourceCharacter
IF EXISTS caseMapping
    SET Result TO caseMapping field 2
ELSE
    SET Result TO SourceCharacter
ENDIF

RETURN

```

### 3.1.5.4 Unicode International Domain Names

### 3.1.5.5 Comparing UTF-16 Strings Ordinally

To do a case-sensitive ordinal comparison of strings, a binary comparison of the UTF-16 code points of the strings is done. To do a case-insensitive ordinal string comparison, ToUpperCase (section 3.1.5.3.1) is done on each string before doing the ordinal comparison.

#### 3.1.5.5.1 CompareStringOrdinal Algorithm

This algorithm compares two UTF-16 strings by doing an ordinal (binary) comparison. Optionally, the caller can request that the comparison be done on the uppercase form of the string.

```

COMMENT CompareStringOrdinal
COMMENT On Entry: StringA           - A UTF-16 string to be compared
COMMENT On Entry: StringB           - Second UTF-16 string to compare
COMMENT On Entry: IgnoreCaseFlag - TRUE to ignore case when comparing
COMMENT
COMMENT On Exit: Result - A value indicating if StringA is less than,
COMMENT                               equal to, or greater than StringB

PROCEDURE CompareStringOrdinal

IF IgnoreCaseFlag is TRUE THEN
    SET StringA TO ToUpperCase(StringA)
    SET StringB TO ToUpperCase(StringB)
ENDIF

SET index TO 0

WHILE index is less than Length(StringA) and
      index is also less than Length(StringB)

    IF StringA[index] is less than StringB[index] THEN
        SET Result TO "StringA is less than StringB"
        RETURN
    ENDIF
    IF StringA[index] is greater than StringB[index] THEN
        SET Result TO "StringA is greater than StringB"
        RETURN
    ENDIF
    INCREMENT index
ENDWHILE

IF Length(StringA) is equal to Length(StringB) THEN
    SET Result TO "StringA is equal to StringB"
ELSE IF Length(StringA) is less than Length(StringB) THEN
    SET Result TO "StringA is less than StringB"
ELSE
    Assert Length(StringA) has to be greater than Length(StringB)
    SET Result TO "StringA is greater than StringB"
ENDIF
RETURN

```

### **3.1.6 Timer Events**

None.

### **3.1.7 Other Local Events**

None.

## 4 Protocol Examples

## 5 Security

The following sections specify security considerations for implementers of the Windows Protocols Unicode Reference.

### 5.1 Security Considerations for Implementers

None.

### 5.2 Index of Security Parameters

None.

## 6 (Updated Section) Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs.

- Windows NT operating system
- Windows 2000 operating system
- Windows XP operating system
- Windows Server 2003 operating system
- Windows Vista operating system
- Windows Server 2008 operating system
- Windows 7 operating system
- Windows Server 2008 R2 operating system
- Windows 8 operating system
- Windows Server 2012 operating system
- Windows 8.1 operating system
- Windows Server 2012 R2 operating system
- Windows 10 operating system
- Windows Server 2016 operating system
- Windows Server operating system
- **Windows Server 2019 operating system**

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> Section 3.1.5.2.3: Only Windows NT, Windows 2000, Windows XP, Windows Server 2003, Windows Vista, Windows Server 2008, Windows 7, and Windows Server 2008 R2 use record count for DEFAULT.

<2> Section 3.1.5.2.3: An LCID is used in Windows NT, Windows 2000, Windows XP, Windows Server 2003, Windows Vista, Windows Server 2008, Windows 7, and Windows Server 2008 R2.

<3> Section 3.1.5.2.3.1: The files in the download map to specific Windows versions as follows:

Version	File Name
Windows NT 4.0 operating system, Windows 2000, Windows XP, and Windows Server 2003	Windows NT 4.0 through Windows Server 2003 Sorting Weight Table.txt

Version	File Name

<14> Section 3.1.5.4: The IdnToNameprepUnicode, IdnToAscii, and IdnToUnicode algorithms are not applicable to Windows NT, Windows 2000, Windows XP, or Windows Server 2003. These algorithms follow the IDNA2003 standards for Windows Vista, Windows Server 2008, Windows 7, and Windows Server 2008 R2 operating system. Otherwise, the algorithms follow the IDNA2008+UTS46 standards.

<15> Section 3.1.5.4.6: This version is not used in Windows NT, Windows 2000, Windows XP, Windows Server 2003, Windows Vista, Windows Server 2008, Windows 7, and Windows Server 2008 R2.

<16> Section 3.1.5.4.7: This version is used in Windows Vista, Windows Server 2008, Windows 7, and Windows Server 2008 R2

## 7 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).

Section	Description	Revision class
6 Appendix A: Product Behavior	Added Windows Server 2019 to the list of applicable products and product behavior notes.	Major
